Stack Emissions			
1. Were visible emissions tests conducted during this site visit according to EPA Method 9 (Ref.: Chapter 62-297, F.A.C.)?			
2. Are emissions from silos, weigh hoppers (batchers), and other enclosed storage and conveying equipment controlled to the extent necessary to limit visible emissions to 5 percent opacity?			
3. During visible emissions tests of the silo dust collector exhaust points was the loading of the silo conducted at a rate that is representative of the normal silo loading rate, or at least at the minimum 25 tons per hour rate,			
unless such rate is unachievable in practice?

skip 4.a) and 4.b) and continue on to question 5.)			
b) During the visible emissions test, was the batching rate representative of the normal batching rate and duration?			
5. If emissions from the weigh hopper (batcher) operation are controlled by a dust collector, which is separate from the silo dust collector, are the visible emissions tests of the weigh hopper (batcher) dust collector			
conducted while batching at a rate that is representative of the normal batching rate and duration?  Yes  No

**COMMENTS:** The pop off valve was force open during the loading of dry concret into the silo. The operator explained the the emergency shut off was tampered with, keeping the system from shutting down the truck's ability to overfill the silo. The wind was from the south and blew cement dust to cover the vehicles in the auto dealership next door.
