COMMENTS: A leak was observed in the water separator chamber. Owner appeared to have known because of small container placed under the leak to trap liquid. When asked, owner stated he knew and would order part to replace. Inspector informed owner to make sure he documents the dates the part was ordered, received and repaired. Also, the separator water was not in secondary containment. This facility is a large new source, and there was no evidence that facility is monitoring temperatures at the condenser's inlet and outlet to ensure difference is above 20°F. Items for corrective action were provided to the facility. The leak has since been repaired, the separator water has been placed in secondary containment, and the facility has been informed of the requirement to record the temperatures at the condenser's inlet and outlet to ensure the difference between both is above 20°F. The facility will be doing so from this point forward. See attached photos. Closed without formal enforcement.
