Ken,

Sorry it has taken me this long to respond. I have been out in the field all week. I talked to Kirk Andreano about it and he said it is a dry weight.

Let me know if you need anything else.

Kelly,

You stated that the weight for each 10 cu.yd. truck load of concrete is approximately 30,000 pounds. Is the 30,000 pounds dry weight (wt. of material from the weigh hopper only) or is 30,000 pounds the wet weight of the concrete after water is added? The question on our inspection checklist is, 'What was the batching rate from the weigh hopper in tons/hour'?
