COMMENTS: Four VE tests were performed. The south cement silo is empty and not used due to reduced production. This silo feeds into the mixing bin #2 (east) therefore no VE was done on that silo or the east mixing bin (the drop point from this silo). No changes were made to equipment and no additional equipment was installed leading to increased emissions. No fugitive emissions were seen leaving the property. Diesel fuel for equipment is now stored on site in an AST. Records of product output per day and month were maintained in a computer log. Lynch Oil supplies diesel fuel and provides sulfur analysis for every delivery. Records went back to installation of plant in 2005. No objectionable odors
