**Re: DEP File No. 0310337-016-V  
Title V Air Operational Permit Renewal  
Request for Additional Information**

BUREAU OF AIR REGULATION

Dear Mr. Holtom:

Cedar Bay is in receipt of the Department's letter dated March 23, 2009 requesting additional information relative to specific requested changes during the facility's Title V permit renewal. Cedar Bay provides the following information pertaining to each item identified in the Department's letter.

Item #1. The requested change to Specific Condition A.8., removing the ammonia slip exhaust gas limit when burning fuel oil, will require an air construction permit modification to implement, since such a change cannot be implemented as a Title V air operation permit renewal.

Per the Department's directive Cedar Bay will initiate a modification request to the facility's Air Construction Permit to remove the ammonia slip limit (30 ppmvd) when burning fuel oil. Cedar Bay requests the Department delete the request for the removal of the ammonia slip limit when burning fuel oil from the Title V permit renewal.

Item #2. The requested change to Specific Condition A.26., deleting a reference to sulfur dioxide spans on input and output devices, cites a Department authorization letter dated February 29, 2000. Please provide a copy of this letter.

The facility's SO<sub>2</sub> analyzers have pre-selected ranges and ranging the analyzer with a 100:1 dilution ratio with a span of 1300 ppm was a challenge as potentiometer adjustments of the analyzers were stretched to the limit. After several years of actual SO<sub>2</sub> emission data was collected a request was made to change the span of the SO<sub>2</sub> analyzer to 1000 ppm. In a letter dated February 29, 2000 the Department provided authorization to change the SO<sub>2</sub> span to 1000 ppm (Attachment 1).

Cedar Bay also requested that the reference to SO<sub>2</sub> spans at A.26. (5) be deleted for accuracy purposes. There is no inlet SO<sub>2</sub> monitoring device on a circulating fluidized bed combustor. Cedar Bay's CEM system uses fuel sampling and analysis data to determine inlet SO<sub>2</sub> samples per 40 CFR Part 60 Method 19, 5.3.2.1. Additionally, Cedar Bay is a CAIR affected facility and the SO<sub>2</sub> continuous emission monitoring system is now Part 75 certified. The SO<sub>2</sub> span value and range is determined by standards in Part 75 Appendix A.

Item #3. The requested change to Specific Condition A.59., addressing recycle reject usage mentions a Department authorization document dated July 2006. Please provide a copy of this authorization document.

The Department authorized the change of charging rates of short fiber recycle rejects from the Smurfit Stone mill from cubic yards to tons via modifications to the facility's PSD permit (PSD-FL-137) and Title V permit (Title V permit 0310337-007-AC) on April 26<sup>th</sup>, 2006 (Attachment 2). As part of that modification the short fiber recycle rejects charging rate was modified from cubic yards to tons in A.3.(c). The removal of Specific Condition A.59 should have been included as part of the PSD modification in 2006 but was overlooked.

Item #4. The requested change to Specific Condition A.64., addressing the short fiber recycle rejects test burn protocol, removes the Department approval language from the condition. Please provide a copy of the Department approval letter to implement the supplemental fuel usage at the facility.

Cedar Bay performed a successful test burn of Smurfit Stone's short fiber recycle rejects from August 27<sup>th</sup> to September 25<sup>th</sup>, 2002. The short fiber recycle reject Test Burn Report (Attachment 3) was submitted to the Department on October 17<sup>th</sup>, 2002 to the attention of Mr. Scot Sheplak. The test burn data indicated that Cedar Bay's boilers could burn the short fiber recycle rejects as supplemental fuel without exceeding any of the limitations on boiler emissions, fuel usage and applicable solid waste regulations. Additionally, the test burn validated that the existing fiber reject conveying/boiler feed system and related appurtenances were able to function without causing any operational problems that would affect the reliable operation of the boiler(s).

Cedar Bay has performed a review of environmental archives and, as yet, not been able to locate the Department's response to Cedar Bay's test burn report submittal.

Please contact me by telephone at 904-696-1547 or by e-mail at [jeffwalker@cogentrix.com](mailto:jeffwalker@cogentrix.com) if there is any other information needed or if you have any questions concerning Cedar Bay's Title V permit renewal application.

Dear Mr. Walker:

Subject: SO<sub>2</sub> Span Values for Cedar Bay Generating Plant

I reviewed your December 20 letter which contains a request to adjust the SO<sub>2</sub> span from 1300 ppm to 1000 ppm on the CFB boilers. Based on the historic fuel sulfur content and the emissions monitoring data, the monitor span may be lowered to 1000 ppm as requested. You may also use a 500 ppm SO<sub>2</sub> span on these monitors but if you exceed either of these lower spans you must provide written notification to the Department and adjust the monitor span upwards to ensure that the monitor span covers all operating conditions.

Please contact Martin Costello at 850/921-9511 or myself if you have further questions on this matter.

Re: DEP File No. 0310337-009-AC, 0310337-010-AV and PA 88-24;  
Modification of Permit No.'s PSD-FL-137 and 0310337-007-AV  
Cedar Bay Generating Plant / Duval County

The applicant, Cedar Bay Generating Company, L.P., applied on August 2, 2005, to the Department for a modification to PSD permit number PSD-FL-137 and Title V permit number 0310337-007-AC for its Cedar Bay Generating Plant located in Duval County. The modification is to allow the facility to co-fire a blend of 5% tire-derived fuel (TDF) in its three circulating fluidized bed boilers (A, B and C) as well as to make changes with respect to the measurements of fuel-bound sulfur content and short-fiber reject throughput.

The Department has reviewed the modification request. The referenced air construction permit hereby modifies PSD-FL-137 as follows:

ii.A. Emission Limitations for CBCP Boilers

1. Fluidized Bed Coal Fired Boilers (CFB)

- a. The maximum coal charging rate of each CFB shall neither exceed 104,000 lbs/hr., 39,000 tons per month (30 consecutive days), nor 390,000 tons per year (TPY). This reflects a combined total of 312,000 lbs/hr., 117,000 tons per month, and 1,170,000 TPY for all three CFBs. Tire-derived fuel (TDF) may be utilized as a co-firing fuel, and shall not exceed 5% fuel input by weight on a daily basis. Petroleum coke (petcoke) may be utilized as a co-firing fuel, and shall not exceed 35% fuel input by weight on a daily basis. {Permitting Note: The limitations on the coal charging rate include both coal, TDF and petcoke.}
- b. The maximum charging rate to each of the two CFBs of short fiber recycle rejects from the SK recycling process shall not exceed ~~240 yd<sup>3</sup>/day wet, and 69,588 yd<sup>3</sup>/year wet~~ 420,000 lb/day and 69,600 tons/yr. This reflects a combined total of ~~420 yd<sup>3</sup>/day wet and 139,176 yd<sup>3</sup>/year wet~~ 840,000 lb/day and 139,200 tons/yr for the two CFBs that fire recycle rejects. The third CFB will not utilize recycle rejects, nor will it be equipped with handling and firing equipment for recycle rejects.
- d. ~~The sulfur content of the coal shall not exceed 1.2%, by weight, on an annual basis. The sulfur content shall not exceed 1.7%, by weight, on a shipment (train load) basis. When co-firing coal and petcoke, the blended~~ The fuel input to the CFBs shall not exceed 3.2 lb/MMBtu equivalent SO<sub>2</sub> content. Compliance shall be determined on a monthly basis via a composite of daily fuel samples.

18. The permittee shall submit annual reports to EQD and DEP/BAR summarizing emissions for each calendar year. The reports will commence during the first year in which TDF is fired and continue for a total of five calendar years. Such reports are required in order to confirm Cedar Bay's projections of future actual emissions and to demonstrate to the Department's satisfaction that TDF co-firing did not result in a significant emissions increase. Reporting shall be as follows:

"More Protection, Less Process"

Printed on recycled paper.

<u>Pollutant</u>	<u>Compliance Procedures</u>
<u>NO<sub>x</sub></u>	<u>Five years of annual reporting by CEMS proving annual facility emissions do not exceed 1791.91 TPY</u>
<u>CO</u>	<u>Five years of annual reporting by CEMS proving annual facility emissions do not exceed 541.17 TPY</u>
<u>VOC</u>	<u>Five years of annual reporting by stack test proving annual facility emissions do not exceed 100.73 TPY</u>
<u>SO<sub>2</sub></u>	<u>Five years of annual reporting by CEMS proving annual facility emissions do not exceed 2012.41 TPY</u>
<u>SAM</u>	<u>Five years of annual reporting by stack test proving annual facility emissions do not exceed 7.4 TPY</u>
<u>PM<sub>10</sub></u>	<u>Five years of annual reporting by stack test proving annual facility emissions do not exceed 108.86 TPY</u>

## II. B. CBCP - Material Handling and Treatment

14. Solid Waste Conditions. The permittee shall comply with the following solid waste conditions for TDF:

1. The tire derived fuel (i.e. the processed tires) shall conform to nominal one-inch processed tire chip standards in which less than 10% by weight are retained on a 2-inch square sieve and less than 5% total by weight will pass through a #4 sieve as determined by testing method ASTM D 422-63.
2. The tire derived fuel (TDF) shall conform to nominal one-inch processed tire chip standards in which they shall be less than 1% free wire by weight and less than 3% of the particles contain bead wire.
3. Documentation of the conformance of the TDF with the nominal one-inch processed tire chip standards shall be maintained onsite and be readily available for inspection at all times.
4. The operator shall maintain records of the quantity of TDF received at the site, stored at the site, and shipped from the site.
5. No operations involving the use of open flames shall be conducted within 25 feet of the TDF.
6. TDF piles shall not be constructed, maintained or operated in or within 200 feet of any natural or artificial body of water, including wetlands within the jurisdiction of the Department, except for bodies of water contained completely within the property boundaries of the facility and which do not ordinarily discharge from the site to surface waters.
7. Stormwater control methods for the TDF piles site shall meet the requirements of Chapters 62-25 and 62-330, F.A.C. and shall be managed in such a way as to divert stormwater or flood waters around and away from the storage piles.
8. TDF piles shall be no larger than 50 feet in width, 10,000 square feet in area and 10 feet in height.
9. A 50-foot wide fire lane shall be placed around the perimeter of each TDF pile.
10. The TDF piles site shall be bermed or given other Department approved protection if necessary to keep liquid runoff from a potential TDF fire from entering water bodies.
11. The TDF piles shall be kept free of grass, underbrush, and other potentially flammable vegetation at all times.
12. The TDF inventory shall be no more than one month's projected usage, based on the design capacity for the first six months, and no more than two times the average actual monthly usage during the preceding six months at all times thereafter.
13. Only a registered waste tire collector shall transport the TDF to or from the facility.

A copy of this letter shall be filed with the referenced permit and shall become part of the permit. This permit modification is issued pursuant to Chapter 403, Florida Statutes.

Any party to this order (permit modification) has the right to seek judicial review of it under Section 120.68, F.S., by filing a notice of appeal under Rule 9.110 of the Florida Rules of Appellate Procedure with the clerk of the Department of Environmental Protection in the Office of General Counsel, Mail Station #35, 3900 Commonwealth Boulevard, Tallahassee, Florida, 32399-3000, and by filing a copy of the notice of appeal accompanied by the applicable filing fees with the appropriate District Court of Appeal. # **CEDAR BAY COGENERATING PLANT SHORT FIBER REJECT TEST BURN PROTOCOL**

## **PURPOSE**

Cedar Bay's Conditions of Certification, Prevention of Significant Deterioration and Title V permits allow the combustion of short fiber rejects (SFR) in a single boiler pending the completion of a 30-day test burn designed to ascertain whether the circulating fluidized bed boiler can burn the rejects as supplemental fuel without exceeding permitted limitations on emissions, fuel usage or other environmental conditions and without causing any operational problems which would affect reliable operation. The 30-day test may proceed after submission of a test plan to Florida Department of Environmental Protection (FDEP) and the Air and Water Quality Division of the City of Jacksonville (RESO). This plan is intended to be used for submission to FDEP and RESO and as a guide for the plant to complete the test burn.

## **RATIONALE FOR SFR COMBUSTION**

The Smurfit Stone facility recycles corrugated cardboard to produce recycled paper and linerboard. Cedar Bay entered into a contractual arrangement to supply steam for this process in order to qualify as a cogeneration facility. The arrangement resulted in reduced air emissions by replacing the boilers at the Smurfit Stone facility. Additionally through these agreements, Cedar Bay accepts Smurfit Stone's wastewater for cooling tower make-up, minimizing the discharge of wastewater to the Broward River and to accept a portion of SFR for energy recovery purposes. To date Cedar Bay has met its obligation to accept the material but has made arrangements for the material to be disposed in a landfill due to other contractual constraints. Recently, these contractual constraints have been eliminated and so Cedar Bay is anxious to confirm the ability to burn SFR as originally intended.

## **SFR DESCRIPTION**

Short Fiber Rejects (SFR) is a by-product of the Smurfit Stone recycling process. Bales of corrugated cardboard are shredded, mixed with water and reduced to a pulp. Heavy trash material such as staples, glass, metal and stones sink to the bottom of the pulp slurry and are removed. The slurry is then spun in a centrifuge to remove any additional heavy material. From the centrifuge the slurry passes through a coarse screen, which removes additional contaminants such as wax or plastic. The slurry passes on to another centrifuge and then short and long fibers are separated using two fine mesh screens and a reverse cleaner. The short fibers are pressed to remove liquids and the SFR is transferred to roll-off containers for disposal.

## **SFR COMBUSTION PROCESS & EQUIPMENT**

The Cedar Bay facility was constructed to support combustion of the SFR in two boilers (Boilers B and C) with a dedicated material handling and conveyance system to transport the SFR to the boilers. A detailed description of the process and equipment is found in our operating procedure, which is attached.

SFR is collected from Smurfit Stone's process in dedicated 30 cubic yard capacity roll-off boxes for disposal. Currently Cedar Bay arranges for these to be transferred to a landfill. The plan is to continue to use this method to collect and deliver the material to Cedar Bay's fiber waste handling system on the western boundary of the Smurfit Stone facility. The roll-off boxes will be transported within Smurfit Stone's property to the location of Cedar Bay's fiber waste handling system. The SFR will be unloaded into a receiving hopper as described in the referenced operating procedure. The receiving hopper is equipped

with a live bottom via drag chain feeder and interfaces with Cedar Bay's distributed control system (DCS). The DCS system allows this system, as well as most of the Cedar Bay plant, to be controlled and monitored from Cedar Bay's Control Room.

SFR will be discharged from the receiving hopper by a variable speed drag conveyor to a 24" wide conveyor belt (SFR conveyor). This conveyor is rated at 16 tons per hour at a belt speed of 75 feet per minute. The conveyor is equipped with skirt boards; hood covers, automatic vertical gravity take-up with grab safety devices, speed switch, and pull cord switches and belt alignment switches.

SFR will be discharged from the SFR conveyor into the SFR surge hopper. The surge hopper is sized for a minimum capacity of 20 cubic yards and is equipped with four variable speed screw conveyors, each with their own speed switch. The surge hopper also has three capacitance type level switches. One switch monitors low level, one switch to monitor high level and one switch for emergency high level. Upon actuation of the high level switch, the DCS system will automatically run the drag chain feeder in the receiving hopper in low speed to prevent overflow of the surge hopper. The feeder will return to high speed when the high level switch is no longer actuated. The emergency high-level switch will stop both conveyor and feeder immediately after actuation.

The SFR feed system will feed the SFR to the loop seal feed points of Boiler C and discharge through air locks (rotary valves) to the coal drag chain conveyors feeding the loop seals. The coal conveyors will introduce the coal/fiber waste mix into the loop seal fuel feed port.

The fiber waste will provide less than 5% of the heat input to C boiler when the feed rate is 150 tons/day and the boiler is at full load.

## SCOPE OF TEST BURN

Operational Feasibility: In order to confirm that co-firing of SFR is feasible without adverse impact to operations the following will be monitored using the dedicated operational performance monitoring software:

Verify that all desired data points are arranged to be captured in the plant data collection system.

## **TESTING PROCEDURE**

The plant should be operating in a steady state while maintaining as close to the following parameters as possible:

Main steam temp 1000 deg F +/- 10 deg F

Reheat steam temp 1000 deg F +/- 10 deg F

Main steam pressure 2410 +/- 100 psia

Boiler Blowdown in normal operation

Condenser level in auto

Deaerator level in auto

Steam drum level in auto

Plant in stable condition (no plugged fuel feeders etc) with no major maintenance occurring

Bottom ash screw coolers in steady state operation.

The outside emission testing company should have their equipment in place and ready to collect data from the exit ductwork on Boiler C.

At the point the silo level reaches 0% indication on the DCS or the fuel level reaches the pant leg of the silo the blended test fuel can be fed to the fuel silo. Past experience indicates that it will take about 3 hours for the test burn material to reach the boiler.

Normal automatic operations should be maintained. Boiler operation will be at steady state full load operation at least one hour prior to commencing stack test achieving a minimum 704 Klbs/hr steam flow and 956.7 lbs/mmBtu heat input during emission testing.

## **Fiber Reject Operation Procedure (See Attachment A)**

## 4.0 Description of Source

---

Cedar Bay Generating Company's Unit C is a coal fired circulating fluidized bed steam generating boiler. The boiler supplies steam for power production and process steam for the Stone Container paper mill.

The boiler is equipped with ammonia injection for control of NO<sub>x</sub> emissions and a bag house for control of particulate emissions. The SO<sub>2</sub> emissions are controlled by limestone in the fluidized bed.

The flue gas is exhausted through the Units A, B and C common stack. A schematic of the process and stack sampling location is included in Appendix 3 "Figures".
