CALPUFF MODEL DESCRIPTION AND METHODOLOGY

CALPUFF MODEL DESCRIPTION AND METHODOLOGY

C.1 INTRODUCTION

As part of the new source review (NSR) requirements under Prevention of Significant Deterioration (PSD) regulations, new sources are required to address air quality impacts at PSD Class I areas. As part of the PSD analysis report submitted to the Florida Department of Environmental Protection (FDEP), the air quality impacts due to the potential emissions of the FPL Glades Power Park (FGPP) are required to be addressed at the PSD Class I areas of the Everglades National Park (NP) and Chassahowitzka National Wildlife Area (NWA). The Everglades NP is located approximately 113 kilometers (km) from FGPP and the Chassahowitzka NWA is located approximately 239 km from FGPP.

Currently, there are several air quality modeling approaches recommended by the Interagency Workgroup on Air Quality Models (IWAQM) to perform these analyses. The IWAQM consists of the U.S. Environmental Protection Agency (EPA) and Federal Land Managers (FLMs) of Class I areas who are responsible for ensuring that AQRVs are not adversely impacted by new and existing sources. These recommendations have been summarized in two documents:

- *Interagency Workgroup on Air Quality Models (IWAQM), Phase 2 Summary Report and Recommendations for Modeling Long Range Transport Impacts* (EPA, 1998), referred to as the IWAQM Phase 2 report.
- *Federal Land Managers' Air Quality Related Values Workgroup (FLAG), Phase I Report,* USFS, NPS, USFWS (12/00), referred to as the FLAG document.

For the proposed project, air quality analyses were performed that assess the plant's impacts in the PSD Class I areas using the refined modeling approach from the IWAQM Phase 2 report.

The refined analysis approach was used instead of the screening analysis approach since the air quality impacts are based on generally more realistic assumptions, include more detailed meteorological data, and are estimated at locations at the Class I area.

C.2 GENERAL AIR MODELING APPROACH

The general modeling approach was based on using the long-range transport model, California Puff model [CALPUFF, Version 5.756 (the Best Available Retrofit Technology (BART) Version)]. This version of the model was developed by the Visibility Improvement State and Tribal Association of

the Southeast (VISTAS). At distances beyond 50 km, the AERMOD model is considered to over-predict air quality impacts, because it is a steady-state model. At those distances, the CALPUFF model is recommended for use. The FLMs have requested that air quality impacts, such as for regional haze, for a source located more than 50 km from a Class I area be predicted using the CALPUFF model. The FDEP has also recommended that the CALPUFF model be used to assess if the source has a significant impact at a Class I area located beyond 50 km from the source.

C.3 MODEL SELECTION AND SETTINGS

The CALPUFF air modeling system was used to model and assess the proposed project's impacts at the PSD Class I areas for comparison to the PSD Class I significant impact levels and the PSD Class I increments. CALPUFF is a non-steady state Lagrangian Gaussian puff long-range transport model that includes algorithms for building downwash effects as well as chemical transformations (important for visibility controlling pollutants), and wet/dry deposition. CALPUFF was used in a manner that is recommended by the IWAQM Phase 2 and FLAG reports.

C.3.1 CALPUFF MODEL APPROACHES AND SETTINGS

The IWAQM has recommended approaches for performing a Phase 2 refined modeling analyses that are presented in Table C-1. These approaches involve use of meteorological data, selection of receptors and dispersion conditions, and processing of model output.

The specific settings used in the CALPUFF model are presented in Table C-2.

C.3.2 EMISSION INVENTORY AND BUILDING WAKE EFFECTS

The CALPUFF model included the facility's emission, stack, and operating data as well as building dimensions to account for the effects of building-induced downwash on the emission sources. Dimensions for all significant building structures were processed with the Building Profile Input Program (BPIP), Version 04274, and were included in the CALPUFF model input. The PSD report presents a listing of the facility's emissions and structures included in the analysis.

C.4 RECEPTOR LOCATIONS

For the refined analyses, pollutant concentrations were predicted at 901 receptors located at the Everglades NP and 113 receptors located at the Chassahowitzka NWA. These receptors were developed by the National Park Service and cover all areas along the boundary and internal areas of the Class I areas.

C.5 METEOROLOGICAL DATA

C.5.1 CALMET DOMAINS

The air modeling analysis used CALMET-developed domains that were prepared for BART applications. The data were developed by VISTAS and obtained from the FEDP for the years 2001 to 2003. The data consists of a 3-dimensional gridded domain of 4-km cell resolution.

TABLE C-1
REFINED MODELING ANALYSES RECOMMENDATIONS [a]

Model Input/Output	Description
Meteorology	Use CALMET (minimum 6 to 10 layers in the vertical; top layer must extend above the maximum mixing depth expected); horizontal domain extends 50 to 80 km beyond outer receptors and sources being modeled; terrain elevation and land-use data is resolved for the situation.
Receptors	Within Class I area(s) of concern; obtain regulatory concurrence on coverage.
Dispersion	1. CALPUFF with default dispersion settings. 2. Use MESOPUFF II chemistry with wet and dry deposition. 3. Define background values for ozone and ammonia for area.
Processing	1. For PSD increments: use highest, second highest 3-hour and 24-hour average SO_2 concentrations; highest, second highest 24-hour average PM_{10} concentrations; and highest annual average SO_2, PM_{10} and NO_x concentrations. 2. For haze: process, on a 24-hour basis, compute the source extinction from the maximum increase in emissions of SO_2, NO_x and different size categories of PM_{10} ($PM_{<0.625}$, $PM_{0.625-1.0}$, $PM_{1.0-1.25}$, $PM_{1.25-2.5}$, $PM_{2.5-6.0}$, and $PM_{6.0-10.0}$), compute the daily relative humidity factor [f(RH)], provided from an external disk file; and compute the maximum percent change in extinction using the FLM supplied background extinction data in the FLAG document. 3. For significant impact analysis: use highest annual and highest short-term averaging time concentrations for SO_2, PM_{10} and NO_x.

TABLE C-2
CALPUFF MODEL SETTINGS

Parameter	Setting
Pollutant Species	SO_2, SO_4, NO_x, HNO_3, NO_3, $PM_{<0.625}$, $PM_{0.625-1.0}$, $PM_{1.0-1.25}$, $PM_{1.25-2.5}$, $PM_{2.5-6.0}$, $PM_{6.0-10.0}$, CO
Chemical Transformation	MESOPUFF II scheme, hourly ozone data from FDEP
Deposition	Include both dry and wet deposition, plume depletion
Meteorological/Land Use Input	CALMET
Plume Rise	Transitional, Stack-tip downwash, Partial plume penetration
Dispersion	Puff plume element, PG /MP coefficients, rural mode, ISC building downwash scheme
Terrain Effects	Partial plume path adjustment
Output	Create binary concentration file including output species for SO_4, NO_3, PM_{10}, SO_2, and NO_x; process for visibility change using Method 2 and FLAG background extinctions
Model Processing	For haze: highest predicted 24-hour extinction change (%) for the year For deposition: annual average deposition rates For significant impact analysis: highest predicted annual and highest short-term averaging time concentrations for SO_2, NO_2, PM_{10}, CO
Background Values	Ozone: hourly concentration file; Ammonia: 0.5 ppb

[a] Recommended values by the FDEP.

[a] Facilities or sources within facilities that operate only during the October 1 through April 31 crop season.

[b] Sugar mill sources that operate all year.

[c] Facility-wide SO_2 emission limit of 14 tons/day (1,166.7) lb/hr). Only Boilers 1 and 4 operate during off-crop season.

[1] Only Boilers 1 and 4 operate during the off-crop season. Represents worst-case emissions for 3-hr 1 through Sept. 31 off-crop season operations and October 1 through April 30 for on-crop season.
[2] Facilities or sources that operate only during the October 1 through April 30 crop season.
[3] Sugar mill sources that operate all year.

[a] Facilities or sources within facilities that operate only during the October 1 through April 31 crop season.
[b] Sugar mill sources that operate all year.
[c] Facility-wide SO_2 emission limit of 14 tons/day (1,166,7) lb/hr). Only Boilers 1 and 4 operate during off-crop season.

 ============================
 BPIP PROCESSING INFORMATION:
 ============================

   The P  flag has been set for preparing downwash related data
          for a model run utilizing the PRIME algorithm.

   Inputs entered in METERS     will be converted to meters using
    a conversion factor of    1.0000.  Output will be in meters.

   The UTMP variable is set to UTMY.  The input is assumed to be in
     UTM coordinates.  BPIP will move the UTM origin to the first pair of
     UTM coordinates read.  The UTM coordinates of the new origin will
     be subtracted from all the other UTM coordinates entered to form
     this new local coordinate system.

   The new local coordinates will be displayed in parentheses just below
     the UTM coordinates they represent.

   Plant north is set to   0.00 degrees with respect to True North.

==========
BPIP PROCESSING INFORMATION:
==========

The P flag has been set for preparing downwash related data
for a model run utilizing the PRIME algorithm.

Inputs entered in METERS will be converted to meters using
a conversion factor of 1.0000. Output will be in meters.

The UTMP variable is set to UTMY. The input is assumed to be in
UTM coordinates. BPIP will move the UTM origin to the first pair of
UTM coordinates read. The UTM coordinates of the new origin will
be subtracted from all the other UTM coordinates entered to form
this new local coordinate system.

Plant north is set to 0.00 degrees with respect to True North.

* Results are based on Determinants 1 & 2 on pages 1 & 2 of the GEP Technical Support Document. Determinant 3 may be investigated for additional stack height credit. Final values result after Determinant 3 has been taken into consideration.

** Results were derived from Equation 1 on page 6 of GEP Technical Support Document. Values have been adjusted for any stack-building base elevation differences.

Note: Criteria for determining stack heights for modeling emission limitations for a source can be found in Table 3.1 of the GEP Technical Support Document.

Analyses of fogging and icing impacts due to emissions from
arrays of mechanically-forced cooling towers can be performed
using CALPUFF in conjunction with a cooling tower emissions
processor (CTEMISS) and its associated postprocessors.  Hourly
emissions of water vapor and temperature from each cooling tower
cell are computed for the current cell configuration and ambient
conditions by CTEMISS. CALPUFF models the dispersion of these
emissions and provides cloud information in a specialized format
for further analysis. Output to FOG.DAT is provided in either
'plume mode' or 'receptor mode' format.

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-84). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

INPUT GROUP: 8 -- Size parameters for dry deposition of particles

For SINGLE SPECIES, the mean and standard deviation are used to compute a deposition velocity for NINT (see group 9) size-ranges, and these are then averaged to obtain a mean deposition velocity.

For GROUPED SPECIES, the size distribution should be explicitly specified (by the 'species' in the group), and the standard deviation for each should be entered as 0. The model will then use the deposition velocity for the stated mean diameter.

  is split - nsplit=2 means that 1 puff splits
  into 2
  (NSPLIT)                             Default:   3         ! NSPLIT =  3  !

  Time(s) of a day when split puffs are eligible to
  be split once again; this is typically set once
  per day, around sunset before nocturnal shear develops.
  24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
  0=do not re-split    1=eligible for re-split

  !  IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

  Split is allowed only if last hour's mixing
  height (m) exceeds a minimum value
  (ZISPLIT)                            Default: 100.        ! ZISPLIT = 100.0 !

  Split is allowed only if ratio of last hour's
  mixing ht to the maximum mixing ht experienced
  by the puff is less than a maximum value (this
  postpones a split until a nocturnal layer develops)
  (ROLDMAX)                            Default: 0.25        ! ROLDMAX = 0.25 !

  HORIZONTAL SPLIT

[a] Data for each source are treated as a separate input subgroup and therefore must end with an input group terminator.

SRCNAM is a 12-character name for a source (No default)
X is an array holding the source data listed by the column headings

(No default)
SIGYZI is an array holding the initial sigma-y and sigma-z (m)
(Default: 0.,0.)
FMFAC is a vertical momentum flux factor (0. or 1.0) used to represent the effect of rain-caps or other physical configurations that reduce momentum rise associated with the actual exit velocity.
(Default: 1.0 -- full momentum used)

b
0. = No building downwash modeled, 1. = downwash modeled
NOTE: must be entered as a REAL number (i.e., with decimal point)

c
An emission rate must be entered for every pollutant modeled.
Enter emission rate of zero for secondary pollutants that are modeled, but not emitted. Units are specified by IPTU
(e.g. 1 for g/s).

Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b
Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

 Meteorological data files are needed for the HNO3/NO3 partition option.
 The met data file is the 'CALMET.DAT' format file used in the CALPUFF
 simulation.  If multiple CALMET files had been used in sequence, you
 may list all of these files in subgroup 0b.  Specify the total number
 of CALMET files runs you need to use, and provide the filename for each
 in subgroup 0b.

     Number of CALMET data files (NFILES)

 A number of CALPUFF data files may be processed in this application.
 The files may represent individual CALPUFF simulations that were made
 for a specific set of species and/or sources.  Specify the total number
 of CALPUFF runs you wish to combine, and provide the filename for each
 in subgroup 0b.

     Number of CALPUFF data files (NFILES)

When multiple files are used, a species name may appear in more than
one file.  Data for this species will be summed (appropriate if the
CALPUFF runs use different source groups).  If this summing is not
appropriate, remove duplicate species from the file(s).

     Stop run if duplicate species names
     are found? (MDUPLCT)              Default: 0       ! MDUPLCT  =  0  !
        0 = no  (i.e., duplicate species are summed)
        1 = yes (i.e., run is halted)

Data for each species in a CALPUFF data file may also be scaled as
they are read.  This can be done to alter the emission rate of all
sources that were modeled in a particular CALPUFF application.
The scaling factor for each species is entered in Subgroup (2d), for
each file for which scaling is requested.

     Number of CALPUFF data files that will be scaled

Option to recompute the HNO3/NO3 concentration partition prior to
performing other actions.  This option will NOT alter any deposition
fluxes contained in the CALPUFF file(s).  Two partition selections
are provided.  The first (MNITRATE=1) computes the partition for the
TOTAL (all sources) concentration fields (SO4, NO3, HNO3; NH3), and
the second (MNITRATE=2) uses this partition (from a previous application
of POSTUTIL) to compute the partition for individual source groups.

Required information for MNITRATE=1 includes:
          species NO3, HNO3, and SO4
          NH3 concentration(s)
          met. data file for RH and T

Required information for MNITRATE=2 includes:
          species NO3 and HNO3 for a source group
          species NO3ALL and HNO3ALL for all source groups, properly
                  partitioned

     Recompute the HNO3/NO3 partition for concentrations?
```

```
      (MNITRATE)                    Default: 0       ! MNITRATE  =  0  !
         0 = no
         1 = yes, for all sources combined
         2 = yes, for a source group

      Ammonia concentrations may be available as a modeled species in
      the CALPUFF files.  When NH3 is listed as a processed species in
      Subgroup (2a) (as one of the NSPECINP ASPECI entries), the
      modeled values will be used in the chemical equilibrium calculation.
      If NH3 is not on this list, the default monthly background values
      listed below will be used.  If a single value is entered, this is
      used for all 12 months.  Month 1 is JANUARY, Month 12 is DECEMBER.

      Default ammonia concentration (ppb) used for HNO3/NO3 partition:
      (BCKNH3) in ppb                Default: 12*10.
      ! BCKNH3 = 1., 1., 1., 1.1, 1.4, 1.3, 1.3, 1.2, 4*1. !

--------------
Subgroup (1a) -- Specific gridded receptors included/excluded
--------------

    Specific gridded receptors are excluded from CALPOST processing
    by filling a processing grid array with 0s and 1s.  A total of
    NGONOFF lines are read here.  Each line corresponds to one 'row'
    in the sampling grid, starting with the NORTHERNMOST row that
    contains receptors that you wish to exclude, and finishing with
    row 1 to the SOUTH (no intervening rows may be skipped).  Within
    a row, each receptor position is assigned either a 0 or 1,
    starting with the westernmost receptor.
       0 = gridded receptor not processed
       1 = gridded receptor processed

    Repeated value notation may be used to select blocks of receptors:
       23*1, 15*0, 12*1

    Because all values are initially set to 1, any receptors north of
    the first row entered, or east of the last value provided in a row,
    remain ON.

Plot output options
-------------------

     Plot files can be created for the Top-N, Exceedance, and Echo
     tables selected above.  Two formats for these files are available,
     DATA and GRID.  In the DATA format, results at all receptors are
     listed along with the receptor location [x,y,val1,val2,...].
     In the GRID format, results at only gridded receptors are written,
     using a compact representation.  The gridded values are written in
     rows (x varies), starting with the most southern row of the grid.
     The GRID format is given the .GRD extension, and includes headers
     compatible with the SURFER(R) plotting software.

     A plotting and analysis file can also be created for the daily
     peak visibility summary output, in DATA format only.

Subgroup (1a) -- Specific gridded receptors included/excluded
-------------

    Specific gridded receptors are excluded from CALPOST processing
    by filling a processing grid array with 0s and 1s.  A total of
    NGONOFF lines are read here.  Each line corresponds to one 'row'
    in the sampling grid, starting with the NORTHERNMOST row that
    contains receptors that you wish to exclude, and finishing with
    row 1 to the SOUTH (no intervening rows may be skipped).  Within
    a row, each receptor position is assigned either a 0 or 1,
    starting with the westernmost receptor.
       0 = gridded receptor not processed
       1 = gridded receptor processed

    Repeated value notation may be used to select blocks of receptors:
       23*1, 15*0, 12*1

    Because all values are initially set to 1, any receptors north of
    the first row entered, or east of the last value provided in a row,
    remain ON.

Debbie: Please pass this summary of the 7/25/06 conference call regarding the FP&L Air Modeling Protocol-Advanced Technology Coal Project.

Receptors: The NPS and Fish & Wildlife Service requests that the full NPS data set of receptors for Everglades NP and Chassahowitzka Wilderness be used in the Class I modeling analysis.

Significant Impact Analysis: If a detailed PSD Class I impact assessment is required for one or more pollutant, and inventory of Background PSD Class I increment-affecting sources will be developed with the assistance from the FDEP and the NPS and the FWS. Also minor increment consuming sources of the pollutant of concern within 50 KM of the respective Class I areas will be included in the cumulative increment analysis.

Additional Visibility Assessment: FP&L should submit a Class I visibility following the methodology without any modification as described in FLAG, December 2000 with the variable in CALPOST MVISBK=2 and a maximum f(RH) = 95% for both Class I areas. If FP&L wishes to submit additional visibility analyses they may do so.

CALPUFF Input Group 5: set the variables IDRY=1 and IWET=1
CALPUFF Input Group 5: Save to disk the : Concentrations, Dry Fluxes, Wet Fluxes of the 6 different PM species inputted in Subgroup 3(a).

POSTUTIL: after running POSTUTIL to speciate the PM emissions to SOA, EC, SOIL, and PMC; run POSTUTIL again with the new concentration file and set MNITRATE=1 to properly apportion the available NH3 to nitrate formation.

CALPOST: The NPS and FWS will accept the value of 11.3 (1/Mn) for the variable BEXTRAY for both Class I areas.

The impacts to the Class II increments for Big Cypress National Preserve and Biscayne National Park. Also calculate the total nitrogen deposition impacts to Biscayne NP. Please submit a map depicting receptor locations for both Class II areas prior to the modeling analysis for NPS review.

If there are any questions please contact me via e-mail or phone.

RE: AIR MODELING PROTOCOL FOR ASSESSING POLLUTANT AND AQRV IMPACTS OF THE ADVANCED TECHNOLOGY COAL PROJECT ON THE EVERGLADES NATIONAL PARK

Dear Ms. Nelson:

On behalf of Florida Power & Light Company (FPL), Golder Associates Inc. (Golder) is providing this air modeling protocol to the Florida Department of Environmental Protection (FDEP) for submittal to the National Park Service (NPS) to present the Class I modeling methodologies to be used for the proposed Advanced Technology Coal Project (ATCP). The ATCP is approximately a nominal 1,700 to 1,950 megawatt (MW) supercritical pulverized coal power plant with a net heat rate of approximately 8,700 British thermal units per kilowatt-hour (Btu/kW-hr). Currently, potential project sites are being considered in Hendry and Glades Counties. These sites are both flat and entirely rural in nature and would be situated approximately 90 to 106 kilometers (km) north of the Everglades National Park (ENP). Because the second nearest prevention of significant deterioration (PSD) Class I area, the Chassahowitzka National Wilderness Area (NWA), is approximately 270 km from the proposed sites, the analysis will focus on the ENP. The location of the PSD Class I areas and potential project sites are shown in Figure 1.

The emission rates currently being considered are at or below the following levels: sulfur dioxide (SO_2) – 0.06 pound per million British thermal units (lb/MMBtu); nitrogen oxides (NO_x) – 0.06 lb/MMBtu; particulate matter (PM) (filterable) – 0.015 lb/MMBtu; sulfuric acid mist (SAM) – 0.005 lb/MMBtu; and total PM – 0.025 lb/MMBtu. The air emissions for the ATCP have not been finalized and will be developed based on fuels, design engineering, and an analysis of Best Available Control Technology (BACT).

MODEL OPTIONS AND INPUTS

CALPUFF Model

The California Puff [CALPUFF, Version 5.754 (i.e., BART Version)] air modeling system will be used on this project to predict maximum air quality pollutant and Air Quality Related Value (AQRV) impacts on the ENP. The CALPUFF model is a non-steady state Lagrangian puff long-range transport model that includes algorithms for chemical transformations (important for visibility-controlling pollutants) and wet/dry deposition. Recent technical enhancements, including changes to the over-water boundary layer formulation and coastal effects modules (sponsored by the Minerals Management Service), are included in this version. The CALPUFF model will be used in a manner that is consistent with methodologies recommended in the following documents and as discussed in recent telephone conversations with the NPS:

- Federal Land Managers' (FLMs) AQRV Workgroup (FLAG) guidance document, finalized in December 2000 and referred to as the FLAG Phase I Report; and

- Interagency Workgroup on Air Quality Models (IWAQM) Phase 2 Summary Report and Recommendations for Modeling Long-Range Transport Impacts [U.S. Environmental Protection Agency (EPA), 1998], referred to as the IWAQM Phase 2 report.

Parameter Settings

Parameter settings to be used in the CALPUFF modeling will be based on the latest regulatory guidance. Where the modeling guidance recommends regulatory model defaults, those defaults will be used. For ozone background concentrations, observed hourly ozone data for 2001 through 2003 from CASTNET and AIRS stations will be used. These data are available from the Earth Tech website. A fixed monthly ammonia background concentration of 0.5 parts per billion (ppb) will be used. Parameters will be set to generate an hourly relative humidity file and calculate wet and dry fluxes and concentrations.

A sample CALPUFF control file has been included in Appendix A that provides the parameter settings proposed for this project.

Speciation of Particulate Matter

Based on the latest regulatory guidance, PM emissions for the proposed project will be speciated into filterable and condensable components and into six particle size categories. The effect that each species has on visibility impairment is related to a parameter called the extinction coefficient. The higher the extinction coefficient, the greater that species' effect on visibility. Filterable PM is speciated into coarse (PMC), fine (PMF), and elemental carbon (EC). The default extinction efficiencies for these species are 0.6, 1.0, and 10.0, respectively. PMC is PM with aerodynamic diameter greater than 2.5 microns. Both EC and PMF have aerodynamic diameters equal to or less than 2.5 microns. Condensable PM is comprised of sulfate (SO_4) and secondary organic aerosols (SOA). The extinction efficiencies for these species are 3*f(RH) and 4, respectively, where f(RH) is the relative humidity factor.

PM speciation (PM_{10} versus $PM_{2.5}$) will be developed based on the best available vendor information for the proposed project's emission sources.

Emission Inventory and Building Wake Effects

The CALPUFF model will input the proposed project's emission, stack, and operating data as well as building dimensions to account for the effects of building-induced downwash on the emission sources. Merging of stack flues from the two proposed units will be used, as applicable. Dimensions for all significant building structures will be processed with the Building Profile Input Program (BPIP, Version 04274) and will be included in the CALPUFF model input. For the proposed project, total PM will be input to CALPUFF within six particle size categories. The PM group will then be speciated into filterable and condensable species using the POSTUTIL utility program. Note that emissions for condensable inorganic PM are input directly to CALPUFF as SO_4.

A sample POSTUTIL control file for predicting visibility impairment is included in Appendix B.

Meteorological and Geophysical Data

The air modeling analyses will be conducted using the latest meteorological and geophysical databases which have been developed for use with the most recent versions of CALPUFF. These datasets were prepared by the Visibility Improvement State and Tribal Association of the Southeast (VISTAS) for the purpose of conducting visibility impairment analyses under the Best Available Retrofit Technology (BART) Rule. A discussion of these databases can be found in Section 4.0 of

the document entitled, *Protocol for the Application of the CALPUFF Model for Analyses of BART* (revised March 9, 2006).

For the proposed project, the VISTAS Florida CALMET domain with 4-km spacing (VISTA refined Domain 2) will be used. The data cover the period from 2001 to 2003. Golder obtained these datasets from the FDEP. The FDEP and FLM have approved their use for this project.

Receptors

The NPS has developed 901 receptors to represent the boundary and internal areas for the ENP. Golder has reduced this dataset to 251 by reducing the interior receptor resolution of the set and retaining all boundary receptors, even on the south side of the ENP, as shown in Figure 2. The 251-receptor set has been used on prior PSD projects where the source to be modeled is a considerable distance from the ENP. Because the ENP is approximately 90 km from the proposed project site, the receptor set is proposed for capturing the maximum predicted impacts for this project.

ANALYSIS METHODOLOGY

The following paragraphs summarize the processing methods for assessing the proposed project's concentration impact on the ENP and on the AQRVs of deposition and visibility.

Significant Impact Analyses

The CALPUFF model will be used to perform a PSD Class I significant impact analysis at the ENP. The maximum predicted SO_2, nitrogen dioxide (NO_2), and PM_{10} concentrations due to the proposed project will be compared to EPA's proposed PSD Class I significant impact levels. If the project's impacts exceed the proposed EPA PSD Class I significant impact levels, then a more detailed PSD Class I increment analysis will be performed on a pollutant-specific basis. In the PSD Class I incremental analysis, PSD increment-affecting sources will be modeled for comparison to the allowable PSD Class I increments. The proposed PSD Class I significant impact levels are:

- SO_2: 3-hour – 1.0 micrograms per cubic meter ($\mu g/m^3$, 24-hour – 0.2 $\mu g/m^3$; and annual average – 0.1 $\mu g/m^3$,
- NO_2: annual average – 0.1 $\mu g/m^3$,
- PM_{10}: 24-hour – 0.3 $\mu g/m^3$; and annual average – 0.2 $\mu g/m^3$,

If a detailed PSD Class I impact assessment is required for one or more pollutants, an inventory of background PSD Class I increment-affecting sources will be developed with assistance from the FDEP.

Visibility

Based on the FLAG document, current regional haze guidelines characterize a change in visibility by the change in the light-extinction coefficient (b_{ext}). The b_{ext} is the attenuation of light per unit distance due to the scattering and absorption by gases and particles in the atmosphere. A change in the extinction coefficient produces a perceived visual change. An index that simply quantifies the percent change in visibility due to the operation of a source is calculated as:

$$\Delta\% = (bexts / bextb) \times 100$$

where: b_{exts} is the extinction coefficient calculated for the source, and

b_{extb} is the background extinction coefficient.

The purpose of the visibility analysis is to calculate the extinction at each receptor for each day (24-hour period) of the year due to the proposed project emissions. The criteria to determine if the project's impacts are potentially significant are based on a change in extinction of 5 percent or greater for any day of the year.

The CALPUFF postprocessor model CALPOST will be used to calculate the combined visibility effects from the different pollutants that are emitted from the proposed project. Based on communications with the NPS, daily background extinction coefficients are to be calculated on an hour-by-hour basis using hourly relative humidity data from CALMET and hygroscopic and non-hygroscopic extinction components specified in the FLAG document (Visibility Method 2). For the ENP, the hygroscopic and non-hygroscopic components are 0.9 and 8.5 inverse megameter (Mm-1), respectively. CALPOST then calculates the percent extinction change for each day of the year. A Rayleigh scattering term of 11.3 Mm-1 will be used for the analysis. This value is from Table A of the document entitled, *Revised IMPROVE Algorithm for Estimating Light Extinction from Particle Speciation Data* (IMPROVE, 2005).

A sample CALPOST control file for visibility impairment using Method 2 is included in Appendix C.

Additional Visibility Assessments

In order to provide additional useful information for this analysis, Golder will determine the weather conditions for all days for which the visibility impairment is predicted to exceed 5 percent using Method 2. This analysis will review those days and identify hours with potential meteorological conditions, such as rain and fog, that lead to existing reduced visibility conditions. These conditions often produce unrealistic impacts for a source when the visibility is already reduced due to natural causes.

Golder will also perform the visibility impairment analysis using Visibility Method 6, which applies monthly average relative humidity factors based in values from Table A-3 of the EPA document, *Guidance for Estimating Natural Visibility Conditions Under the Regional Haze Rule* (September 2003). This approach is currently recommended for sources that are affected by the BART regulations and uses the predicted 98th percentile concentration to compare to visibility criteria. This comparison will provide an additional assessment of potential visibility impairment for the project based on the evolving approach in assessing regional haze impacts at PSD Class I areas.

Deposition

As part of the AQRV analyses, total sulfur (S) and nitrogen (N) deposition rates will be predicted for the proposed project at the ENP. The deposition analysis criterion is based on the annual averaging period. The total deposition is estimated in units of kilograms per hectare per year (kg/ha/yr) of nitrogen or sulfur. The CALPUFF model is used to predict wet and dry deposition fluxes of various oxides of these elements.

For N deposition, the species include:

- Particulate ammonium nitrate (from species NO_3), wet and dry deposition;
- Nitric acid (species HNO_3), wet and dry deposition;
- NO_x dry deposition; and
- Ammonium sulfate (species SO_4), wet and dry deposition.

For S deposition, the species include:

- SO_2, wet and dry deposition; and
- SO_4, wet and dry deposition.

The CALPUFF model produces results in units of micrograms per square meter per second ($\mu g/m^2/s$). The modeled deposition rates will be converted to N or S deposition in kilograms per hectare (kg/ha) respectively, by using a multiplier equal to the ratio of the molecular weights of the substances (IWAQM Phase II Report, Section 3.3).

Deposition analysis thresholds (DAT) for total N and S deposition, of 0.01 kg/ha/yr, were provided by the U.S. Fish and Wildlife Service (USFWS) (January 2002). A DAT is the additional amount of N or S deposition within a Class I area, below which estimated impacts from a proposed new or modified source are considered insignificant. The maximum N and S depositions predicted for the proposed project will be compared to these DAT or significant impact levels.

The wet and dry sulfate and nitrate fluxes will be converted into total N and S fluxes using the POSTUTIL utility program.

A sample POSTUTIL control file for deposition and a sample CALPOST control file for N deposition are included in Appendix D.

We look forward to receiving your comments on this protocol and working with the FDEP and the NPS on this important project. If there are any questions, please contact me or Ken Kosky at (352) 336-5600.

Analyses of fogging and icing impacts due to emissions from
arrays of mechanically-forced cooling towers can be performed
using CALPUFF in conjunction with a cooling tower emissions
processor (CTEMISS) and its associated postprocessors.  Hourly
emissions of water vapor and temperature from each cooling tower
cell are computed for the current cell configuration and ambient
conditions by CTEMISS. CALPUFF models the dispersion of these
emissions and provides cloud information in a specialized format
for further analysis. Output to FOG.DAT is provided in either
'plume mode' or 'receptor mode' format.

----------
Note:  Latitudes and longitudes should be positive, and include a
       letter N,S,E, or W indicating north or south latitude, and
       east or west longitude.  For example,
       35.9  N Latitude  =  35.9N
       118.7 E Longitude = 118.7E

Datum-region
------------

The Datum-Region for the coordinates is identified by a character
string.  Many mapping products currently available use the model of the
Earth known as the World Geodetic System 1984 (WGS-84).  Other local
models may be in use, and their selection in CALMET will make its output
consistent with local mapping products.  The list of Datum-Regions with
official transformation parameters is provided by the National Imagery and
Mapping Agency (NIMA).

INPUT GROUP: 8 -- Size parameters for dry deposition of particles

For SINGLE SPECIES, the mean and standard deviation are used to compute a deposition velocity for NINT (see group 9) size-ranges, and these are then averaged to obtain a mean deposition velocity.

For GROUPED SPECIES, the size distribution should be explicitly specified (by the 'species' in the group), and the standard deviation for each should be entered as 0. The model will then use the deposition velocity for the stated mean diameter.

     Data for each source are treated as a separate input subgroup
     and therefore must end with an input group terminator.

     SRCNAM  is a 12-character name for a source
             (No default)
     X       is an array holding the source data listed by the column headings
             (No default)
     SIGYZI  is an array holding the initial sigma-y and sigma-z (m)
             (Default: 0.,0.)
```

FMFAC is a vertical momentum flux factor (0. or 1.0) used to represent the effect of rain-caps or other physical configurations that reduce momentum rise associated with the actual exit velocity. (Default: 1.0 -- full momentum used)

[b]
0. = No building downwash modeled, 1. = downwash modeled
NOTE: must be entered as a REAL number (i.e., with decimal point)

[c]
An emission rate must be entered for every pollutant modeled. Enter emission rate of zero for secondary pollutants that are modeled, but not emitted. Units are specified by IPTU (e.g. 1 for g/s).

Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b
Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

Input Files
-----------

 Meteorological data files are needed for the HNO3/NO3 partition option.
 The met data file is the 'CALMET.DAT' format file used in the CALPUFF
 simulation.  If multiple CALMET files had been used in sequence, you
 may list all of these files in subgroup 0b.  Specify the total number
 of CALMET files runs you need to use, and provide the filename for each
 in subgroup 0b.

     Number of CALMET data files (NFILES)
                                  Default: 0       ! NMET    = 0   !

 A number of CALPUFF data files may be processed in this application.
 The files may represent individual CALPUFF simulations that were made
 for a specific set of species and/or sources.  Specify the total number
 of CALPUFF runs you wish to combine, and provide the filename for each
 in subgroup 0b.

     Number of CALPUFF data files (NFILES)
                                  Default: 1       ! NFILES  = 1   !

 All filenames will be converted to lower case if LCFILES = T
 Otherwise, if LCFILES = F, filenames will be converted to UPPER CASE

     Convert filenames to lower case?  Default: T     ! LCFILES = T !
         T = lower case
         F = UPPER CASE

    Number of species to compute from those modeled
    (must be no greater than NSPECOUT)
                           (NSPECCMP) -- No default    ! NSPECCMP = 4 !

When multiple files are used, a species name may appear in more than
one file.  Data for this species will be summed (appropriate if the
CALPUFF runs use different source groups).  If this summing is not
appropriate, remove duplicate species from the file(s).

    Stop run if duplicate species names
    are found? (MDUPLCT)              Default: 0       ! MDUPLCT  =  0  !
       0 = no  (i.e., duplicate species are summed)
       1 = yes (i.e., run is halted)

Data for each species in a CALPUFF data file may also be scaled as
they are read.  This can be done to alter the emission rate of all
sources that were modeled in a particular CALPUFF application.
The scaling factor for each species is entered in Subgroup (2d), for
each file for which scaling is requested.

    Number of CALPUFF data files that will be scaled
    (must be no greater than NFILES)
    (NSCALED)                         Default: 0       ! NSCALED = 0 !

Option to recompute the HNO3/NO3 concentration partition prior to
performing other actions.  This option will NOT alter any deposition
fluxes contained in the CALPUFF file(s).  Two partition selections
are provided.  The first (MNITRATE=1) computes the partition for the
TOTAL (all sources) concentration fields (SO4, NO3, HNO3; NH3), and
the second (MNITRATE=2) uses this partition (from a previous application
of POSTUTIL) to compute the partition for individual source groups.

Required information for MNITRATE=1 includes:
        species NO3, HNO3, and SO4
        NH3 concentration(s)
```

```
            met. data file for RH and T

 Required information for MNITRATE=2 includes:
            species NO3 and HNO3 for a source group
            species NO3ALL and HNO3ALL for all source groups, properly
                    partitioned

      Recompute the HNO3/NO3 partition for concentrations?
      (MNITRATE)                    Default: 0       ! MNITRATE  =  0  !
         0 = no
         1 = yes, for all sources combined
         2 = yes, for a source group

      Ammonia concentrations may be available as a modeled species in
      the CALPUFF files.  When NH3 is listed as a processed species in
      Subgroup (2a) (as one of the NSPECINP ASPECI entries), the
      modeled values will be used in the chemical equilibrium calculation.
      If NH3 is not on this list, the default monthly background values
      listed below will be used.  If a single value is entered, this is
      used for all 12 months.  Month 1 is JANUARY, Month 12 is DECEMBER.

      Default ammonia concentration (ppb) used for HNO3/NO3 partition:
      (BCKNH3) in ppb               Default: 12*10.
      ! BCKNH3 = 1., 1., 1., 1.1, 1.4, 1.3, 1.3, 1.2, 4*1. !

Subgroup (2d)

Each species in NSCALED CALPUFF data files may be scaled before being processed (e.g., to change the emission rate for all sources modeled in the run that produced a data file). For each file, identify the file name and then provide the name(s) of the scaled species and the corresponding scaling factors (A,B where x' = Ax+B).

--------------
Subgroup (1a) -- Specific gridded receptors included/excluded
--------------

    Specific gridded receptors are excluded from CALPOST processing
    by filling a processing grid array with 0s and 1s.  A total of
    NGONOFF lines are read here.  Each line corresponds to one 'row'
    in the sampling grid, starting with the NORTHERNMOST row that
    contains receptors that you wish to exclude, and finishing with
    row 1 to the SOUTH (no intervening rows may be skipped).  Within
    a row, each receptor position is assigned either a 0 or 1,
    starting with the westernmost receptor.
       0 = gridded receptor not processed
       1 = gridded receptor processed

    Repeated value notation may be used to select blocks of receptors:
       23*1, 15*0, 12*1

    Because all values are initially set to 1, any receptors north of
    the first row entered, or east of the last value provided in a row,
    remain ON.

Plot output options
-------------------

    Plot files can be created for the Top-N, Exceedance, and Echo
    tables selected above.  Two formats for these files are available,
    DATA and GRID.  In the DATA format, results at all receptors are
    listed along with the receptor location [x,y,val1,val2,...].
    In the GRID format, results at only gridded receptors are written,
    using a compact representation.  The gridded values are written in
    rows (x varies), starting with the most southern row of the grid.
    The GRID format is given the .GRD extension, and includes headers
    compatible with the SURFER(R) plotting software.

    A plotting and analysis file can also be created for the daily
    peak visibility summary output, in DATA format only.

    when available?
                                (LGRD) -- Default: F   ! LGRD  = F !

Additional Output Options

   Output selected information to List file
    for debugging?
                              (LDEBUG) -- Default: F  ! LDEBUG  = F !

 Meteorological data files are needed for the HNO3/NO3 partition option.
 The met data file is the 'CALMET.DAT' format file used in the CALPUFF
 simulation.  If multiple CALMET files had been used in sequence, you
 may list all of these files in subgroup 0b.  Specify the total number
 of CALMET files runs you need to use, and provide the filename for each
 in subgroup 0b.

     Number of CALMET data files (NFILES)
                                    Default: 0       ! NMET    = 0   !

 A number of CALPUFF data files may be processed in this application.
 The files may represent individual CALPUFF simulations that were made
 for a specific set of species and/or sources.  Specify the total number
 of CALPUFF runs you wish to combine, and provide the filename for each
 in subgroup 0b.

     Number of CALPUFF data files (NFILES)
                                    Default: 1       ! NFILES  = 2   !

 All filenames will be converted to lower case if LCFILES = T
 Otherwise, if LCFILES = F, filenames will be converted to UPPER CASE

     Convert filenames to lower case?  Default: T     ! LCFILES = T !

   When multiple files are used, a species name may appear in more than
   one file.  Data for this species will be summed (appropriate if the
   CALPUFF runs use different source groups).  If this summing is not
   appropriate, remove duplicate species from the file(s).

      Stop run if duplicate species names
      are found? (MDUPLCT)              Default: 0       ! MDUPLCT  =  0  !
         0 = no  (i.e., duplicate species are summed)
         1 = yes (i.e., run is halted)

   Data for each species in a CALPUFF data file may also be scaled as
   they are read.  This can be done to alter the emission rate of all
   sources that were modeled in a particular CALPUFF application.
   The scaling factor for each species is entered in Subgroup (2d), for
   each file for which scaling is requested.

   Option to recompute the HNO3/NO3 concentration partition prior to
   performing other actions.  This option will NOT alter any deposition
   fluxes contained in the CALPUFF file(s).  Two partition selections
   are provided.  The first (MNITRATE=1) computes the partition for the
   TOTAL (all sources) concentration fields (SO4, NO3, HNO3; NH3), and
   the second (MNITRATE=2) uses this partition (from a previous application
   of POSTUTIL) to compute the partition for individual source groups.

   Required information for MNITRATE=1 includes:
           species NO3, HNO3, and SO4
```

```
           NH3 concentration(s)
           met. data file for RH and T

 Required information for MNITRATE=2 includes:

           species NO3ALL and HNO3ALL for all source groups, properly
                   partitioned

        1 = yes, for all sources combined
        2 = yes, for a source group

     Ammonia concentrations may be available as a modeled species in
     the CALPUFF files.  When NH3 is listed as a processed species in
     Subgroup (2a) (as one of the NSPECINP ASPECI entries), the
     modeled values will be used in the chemical equilibrium calculation.
     If NH3 is not on this list, the default background value listed
     below will be used.

    Specific gridded receptors are excluded from CALPOST processing
    by filling a processing grid array with 0s and 1s.  A total of
    NGONOFF lines are read here.  Each line corresponds to one 'row'
    in the sampling grid, starting with the NORTHERNMOST row that
    contains receptors that you wish to exclude, and finishing with
    row 1 to the SOUTH (no intervening rows may be skipped).  Within
    a row, each receptor position is assigned either a 0 or 1,

Types of tabulations reported
-----------------------------

1) Visibility: daily visibility tabulations are always reported
               for the selected receptors when ASPEC = VISIB.
               In addition, any of the other tabulations listed
               below may be chosen to characterize the light
               extinction coefficients.
               [List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected

                          (LT50) -- Default: T    !   LT50 = F  !

3) Top 'N' table for each averaging time selected
   [List file or Plot file]
                         (LTOPN) -- Default: F    !  LTOPN = T  !

     -- Number of 'Top-N' values at each receptor
        selected (NTOP must be <= 4)
                          (NTOP) -- Default: 4    ! NTOP =  1   !

     -- Specific ranks of 'Top-N' values reported
        (NTOP values must be entered)
                 (ITOP(4) array) -- Default:      ! ITOP =  1  !
                                    1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
   time selected
   [List file or Plot file]
                         (LEXCD) -- Default: F    !  LEXCD = F  !

     selected and output is grouped by day
     [List file or Plot file]
                          (LECHO) -- Default: F   !  LECHO = F  !

     Timeseries Option -- Averages at all selected receptors for
     each selected averaging period are written to timeseries files.
     Each file contains one averaging period, and all receptors are
     written to a single record each averaging time.
     [TSttUUUU.DAT files]
                          (LTIME) -- Default: F   !  LTIME = F  !

Plot output options
-------------------

     Plot files can be created for the Top-N, Exceedance, and Echo
     tables selected above.  Two formats for these files are available,
     DATA and GRID.  In the DATA format, results at all receptors are
     listed along with the receptor location [x,y,val1,val2,...].
     In the GRID format, results at only gridded receptors are written,
     using a compact representation.  The gridded values are written in
     rows (x varies), starting with the most southern row of the grid.
     The GRID format is given the .GRD extension, and includes headers
     compatible with the SURFER(R) plotting software.

     A plotting and analysis file can also be created for the daily
     peak visibility summary output, in DATA format only.

     Generate Plot file output in addition to writing tables
     to List file?
                                (LPLT) -- Default: F   ! LPLT  = F !

     Use GRID format rather than DATA format,
     when available?
                                (LGRD) -- Default: F   ! LGRD  = F !

Additional Output Options
-------------------------

   Output selected information to List file
    for debugging?
                              (LDEBUG) -- Default: F  ! LDEBUG  = F !

   Output hourly extinction information to REPORT.HRV?
    (Visibility Method 7)
                             (LVEXTHR) -- Default: F  ! LVEXTHR = F !
