Subject: Test Data for Cargill's No. 8 & 9 Sulfuric Acid Plants
To: Gerald Kissel TPA
CC: Alvaro Linero TAL

Cargill has applied for a modification of PSD-FL-209 to shift 200 TPD of production from SAP No. 8 to No. 9 at their Riverview facility. Our main concern is that actual emissions aren't going to increase by switching production from a "lower" emitting plant to a "higher" emitting plant. A letter just received from Cargill states that the most recent compliance test results for the two plants show that No. 8 is the "higher" emitter of SO₂. Could you have someone check past tests for the No. 8 plant to see if the SO₂ results have been less than the single test performed to date on No. 9? Thanks.
