## 4.2.2.2 Can Coating[1-4]

### 4.2.2.2.1 Process Description

Cans may be made from a rectangular sheet (body blank) and 2 circular ends (3-piece cans), or they can be drawn and wall ironed from a shallow cup to which an end is attached after the can is filled (2-piece cans). There are major differences in coating practices, depending on the type of can and the product packaged in it. Figure 4.2.2.2-1 depicts a 3-piece can sheet printing operation.

There are both "toll" and "captive" can coating operations. The former fill orders to customer specifications, and the latter coat the metal for products fabricated within one facility. Some can coating operations do both toll and captive work, and some plants fabricate just can ends.

Three-piece can manufacturing involves sheet coating and can fabricating. Sheet coating includes base coating and printing or lithographing, followed by curing at temperatures of up to 220°C (425°F). When the sheets have been formed into cylinders, the seam is sprayed, usually with a lacquer, to protect the exposed metal. If they are to contain an edible product, the interiors are spray coated, and the cans baked at up to 220°C (425°F).

Two-piece cans are used largely by beer and other beverage industries. The exteriors may be reverse roll coated in white and cured at 170 to 200°C (325 to 400°F). Several colors of ink are then transferred (sometimes by lithographic printing) to the cans as they rotate on a mandrel. A protective varnish may be roll coated over the inks. The coating is then cured in a single or multipass oven at temperatures of 180 to 200°C (350 to 400°F). The cans are spray coated on the interior and spray and/or roll coated on the exterior of the bottom end. A final baking at 110 to 200°C (225 to 400°F) completes the process.

### 4.2.2.2.2 Emissions And Controls

Emissions from can coating operations depend on composition of the coating, coated area, thickness of coat, and efficiency of application. Post-application chemical changes and nonsolvent contaminants like oven fuel combustion products may also affect the composition of emissions. All solvent used and not recovered can be considered potential emissions.

Sources of can coating VOC emissions include the coating area and the oven area of the sheet base and lithographic coating lines, the 3-piece can side seam and interior spray coating processes, and the 2-piece can coating and end sealing compound lines. Emission rates vary with line speed, can or sheet size, and coating type. On sheet coating lines, where the coating is applied by rollers, most solvent evaporates in the oven. For other coating processes, the coating operation itself is the major source. Emissions can be estimated from the amount of coating applied by using the factors in Table 4.2.2.1-1 or, if the number and general nature of the coating lines are known, from Table 4.2.2.2-1.

Incineration and the use of waterborne and low solvent coatings both reduce organic vapor emissions. Other technically feasible control options, such as electrostatically sprayed powder coatings, are not presently applicable to the whole industry. Catalytic and thermal incinerators both can be used. Primers, backers (coatings on the reverse or backside of the coil), and some waterborne low- to medium-gloss topcoats have been developed that equal the performance of organic

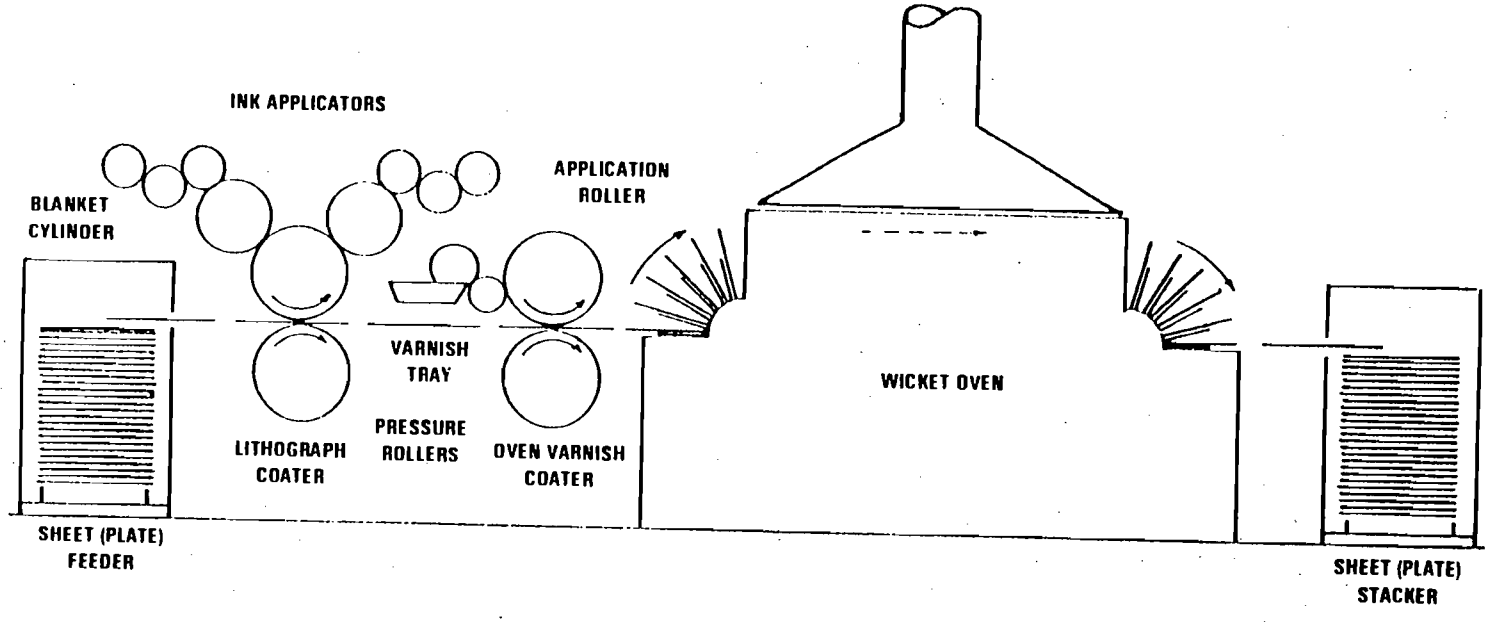

Figure 4.2.2.2-1. Three-piece can sheet printing operation.

Table 4.2.2.2-1 (Metric And English Units). VOC EMISSION FACTORS FOR CAN COATING PROCESSES[a]

EMISSION FACTOR RATING: B

| Process | Typical Emissions From Coating Line[b] | | Estimated Fraction From Coater Area (%) | Estimated Fraction From Oven (%) | Typical Organic Emissions[c] | |
|---|---|---|---|---|---|---|
| | kg/hr | lb/hr | | | Mg/yr | ton/yr |
| Three-piece can sheet base coating line | 51 | 112 | 9 - 12 | 88 - 91 | 160 | 176 |
| Three-piece can sheet lithographic coating line | 30 | 65 | 8 - 11 | 89 - 92 | 50 | 55 |
| Three-piece beer and beverage can — side seam spray coating process | 5 | 12 | 100 | air dried | 18 | 20 |
| Three-piece beer and beverage can — interior body spray coating process | 25 | 54 | 75 - 85 | 15 - 25 | 80 | 88 |
| Two-piece can coating line | 39 | 86 | ND | ND | 260 | 287 |
| Two-piece can end sealing compound line | 4 | 8 | 100 | air dried | 14 | 15 |

[a] Reference 3. ND = no data.
[b] Organic solvent emissions will vary according to line speed, size of can or sheet being coated, and type of coating used.
[c] Based upon normal operating conditions.

solventborne coatings for aluminum but have not yet been applied at full line speed in all cases. Waterborne coatings for other metals are being developed.

Available control technology includes the use of add-on devices like incinerators and carbon adsorbers and a conversion to low solvent and ultraviolet curable coatings. Thermal and catalytic incinerators both may be used to control emissions from 3-piece can sheet base coating lines, sheet lithographic coating lines, and interior spray coating. Incineration is applicable to 2-piece can coating lines. Carbon adsorption is most acceptable to low temperature processes which use a limited number of solvents. Such processes include 2- and 3-piece can interior spray coating, 2-piece can end sealing compound lines, and 3-piece can side seam spray coating.

Low solvent coatings are not yet available to replace all the organic solventborne formulations presently used in the can industry. Waterborne basecoats have been successfully applied to 2-piece cans. Powder coating technology is used for side seam coating of noncemented 3-piece cans.

Ultraviolet curing technology is available for rapid drying of the first 2 colors of ink on 3-piece can sheet lithographic coating lines.

The efficiencies of various control technologies for can coating lines are presented in Table 4.2.2.2-2.

Table 4.2.2.2-2. CONTROL EFFICIENCIES FOR CAN COATING LINES[a]

| Affected Facility[b] | Control Option | Reduction (%)[c] |
|---|---|---|
| Two-piece Can Lines | | |
| Exterior coating | Thermal and catalytic incineration | 90 |
| | Waterborne and high solids coating | 60 - 90 |
| | Ultraviolet curing | ≤100 |
| Interior spraying coating | Thermal and catalytic incineration | 90 |
| | Waterborne and high solids coating | 60 - 90 |
| | Powder coating | 100 |
| | Carbon adsorption | 90 |
| Three-piece Can Lines | | |
| Sheet coating lines | | |
| Exterior coating | Thermal and catalytic incineration | 90 |
| | Waterborne and high solids coating | 60 - 90 |
| | Ultraviolet curing | ≤100 |
| Interior spray coating | Thermal and catalytic incineration | 90 |
| | Waterborne and high solids coating | 60 - 90 |
| Can fabricating lines | | |
| Side seam spray coating | Waterborne and high solids coating | 60 - 90 |
| | Powder (only for uncemented seams) | 100 |
| Interior spray coating | Thermal and catalytic incineration | 90 |
| | Waterborne and high solids coating | 60 - 90 |
| | Powder (only for uncemented seams) | 100 |
| | Carbon adsorption | 90 |
| End Coating Lines | | |
| Sealing compound | Waterborne and high solids coating | 70 - 95 |
| Sheet coating | Carbon adsorption | 90 |
| | Thermal and catalytic incineration | 90 |
| | Waterborne and high solids coating | 60 - 90 |

[a] Reference 3.
[b] Coil coating lines consist of coaters, ovens, and quench areas. Sheet, can, and end wire coating lines consist of coaters and ovens.
[c] Compared to conventional solvent base coatings used without any added thinners.

Re: Hillsborough County - AP
DEP File No. 0570160-009-AC

Dear Mr. Grimley:

Please be advised that the Environmental Protection Commission of Hillsborough County (EPC), as delegated by the Florida Department of Environmental Protection (DEP), has completed their initial review of the revised application received on January 25, 1999 and found it to be incomplete. In order to complete the review process the following additional information is being requested pursuant to Chapter 62-4.055, F.A.C.:

1. Section 1-3.24 requires public notification of construction permit applications as follows:

* Applicants shall give written notice to each Neighborhood Organization registered with the EPC, that lies within one mile of any proposed activity under consideration for a construction permit. At the Director's discretion, applicants may be directed to provide the same written notice to Neighborhood Organizations further than one mile from the proposed activity and/or for activities to be covered by an operation permit. The EPC will provide the applicant with the affected Neighborhood Organization list, and within 10 days of receipt of this list, the applicant will provide the EPC written evidence that the Neighborhood Organizations were notified. The notice to the Neighborhood Organizations shall include a description of the air emission source, the nature of the air emissions, the proposed startup date and the name of a contact person at the EPC for further information.

BEST AVAILABLE COPY

* Applicants shall post a sign at the location of any proposed activity under consideration for a construction permit. At the Director's discretion, applicants my be directed to post the same sign for activities to be covered by an operation permit. The EPC will provide the applicant with the sign. It must be posed conspicuously on the property, so as to be readily viewable from the busiest adjacent public roadway. The applicant must pick up and post the sign within 15 days of submitting an application, and leave it posted on-site for no less than 30 days.

To date EPC has not received evidence that these criteria have been met. The permit cannot be issued.

2. The revised application did not include a signature of the applicant.
3. In the application, the HAP emissions are listed as 25.1 tpy. Does this represent total HAPs or an individual HAP? The reporting threshold for HAPs is one ton. Therefore, any HAP emitted over 1,000 pounds should be listed and summed on an individual HAP basis and total HAPs for the facility.
4. For line #3, what is the HAP emissions associated with this line only. If the any individual HAP emissions are greater than 10 tons or the total HAP emissions are greater than 25 tons, the facility is required to submit the following information for a case-by-case MACT determination in accordance with 40CFR63.43(e):

63.43(d) Principles of MACT determinations. The following general principles shall govern preparation by the owner or operator of each permit application or other application requiring a case-by-case MACT determination concerning construction or reconstruction of a major source, and all subsequent review of and actions taken concerning such an application by the permitting authority:

(1) The MACT emission limitation or MACT requirements recommended by the applicant and approved by the permitting authority shall not be less stringent than the emission control which is achieved in practice by the best controlled similar source, as determined by the permitting authority.

(2) Based upon available information, as defined in this subpart, the MACT emission limitation and control technology (including any requirements under paragraph (d)(3) of this section) recommended by the applicant and approved by the permitting authority shall achieve the maximum degree of reduction in emissions of HAP which can be achieved by utilizing those control technologies that can be identified from the available information, taking into consideration the costs of

BEST AVAILABLE COPY

achieving such emission reduction and any non-air quality health and environmental impacts and energy requirements associated with the emission reduction.

(3) The applicant may recommend a specific design, equipment, work practice, or operational standard, or a combination thereof, and the permitting authority may approve such a standard if the permitting authority specifically determines that it is not feasible to prescribe or enforce an emission limitation under the criteria set forth in section 112(h)(2) of the Act (4). If the Administrator has either proposed a relevant emission standard pursuant to section 112(d) or section 112(h) of the Act or adopted a presumptive MACT determination for the source category which includes the constructed or reconstructed major source, then the MACT requirements of the proposed standard or presumptive MACT determination.

(e) Application requirements for a case-by-case MACT determination.

(1) An application for a MACT determination (whether a permit application under title V of the Act, an application for a Notice of MACT Approval, or other document specified by the permitting authority under paragraph (c)(2)(ii) of this section) shall specify a control technology selected by the owner or operator that, if properly operated and maintained, will meet the MACT emission limitation or standard as determined according to the principles set forth in paragraph (d) of this section.

(2) In each instance where a constructed or reconstructed major source would require additional control technology or a change in control technology, the application for a MACT determination a shall contain the following information:

(i) The name and address (physical location) of the major source to be constructed or reconstructed;

(ii) A brief description of the major source to be constructed or reconstructed and identification of any listed source category or categories in which it is included;

(iii) The expected commencement date for the construction or reconstruction of major source;

(iv) The expected completion date for construction or reconstruction of the major source;

(v) The anticipated date of start-up for the constructed or reconstructed major source;

(vi) The HAP emitted by the constructed or reconst5ructed major source, and the estimated emission rate for each such HAP, to the extent this information is needed by the permitting authority to determine MACT;

(vii) Any federally enforceable emission limitations applicable to the constructed or reconstructed major source;

BEST AVAILABLE COPY

response. A denial for lack of information or response will be unbiased as to the merits of the application. The applicant can reapply as soon as the requested information is available."

If you have any questions, please feel free to contact our office at (813) 272-5530.

Sincerely,

Richard C. Kirby, IV, P.E.
Chief, Air Permitting Section

(ix) The controlled emissions for the constructed or reconstructed major source in tons/yr at expected and maximum utilization of capacity, to the e4xtent this information is needed by the permitting authority to determine MACT;

(x) A recommended emission limitation for the constructed or reconstructed major source consistent with the principles set forth in paragraph (d) of this section;

(xi) The selected control technology to meet the recommended MACT emission limitation, including technical information of the design, operation, size, estimated control efficiency of the control technology (and the manufacturer's name, address, telephone number, and relevant specifications and drawings, if requested by the permitting authority);

(xii) Supporting documentation including identification of alternative control technologies considered by the applicant to meet the emission limitation, and analysis of cost and non-air quality health environmental impacts or energy requirements for the selected control technology; and

(xiii) Any other relevant information required pursuant to subpart A.

(3) In each instance where the owner or operator contends that a const4ructed or reconstructed major source will be in compliance, upon startup, with case-by-case MACT under this subpart without a change in control technology, the application for a MACT determination shall contain the following information:

(i) The information described in paragraphs (e)(2)(I) through (e)(2)(x) of this section; and

(ii) Documentation of the control technology in place.

"NOTICE! Pursuant to the provisions of Chapter 62-4.070, F.A.C. and Section 120.600 F.S., if the EPC does not receive a response to this request for information within 90 days of the date of this letter, the EPC will issue a final order denying your application. You need to respond within 30 days after you receive this letter, responding to as many of the information requests as possible and indicating when a response to any unanswered question will be submitted. If the response will require longer than 90 days to develop, an application for new construction should be submitted when completed information is available. Or for operating permits, you should develop a specific time table for the submission of the requested information for EPC review and consideration. Failure to comply with a time table accepted by the EPC will be grounds for the EPC to issue a Final Order of Denial for lack of timely

Tampa, FL 33605

RE: **Hillsborough County - AP DEP File No. 0570160-009-AC- Ball Metal Beverage Container Corp. - Tampa McKinley Drive.**

Dear Mr. Kirby:

In response to your letter of February 24, 1999, Hillsborough County - AP DEP File No. 0570160-009-AC, please note the following:

1. As discussed in our phone conversation of March 16, 1999, notification will be submitted to the agency immediately upon acknowledgement that such action may be taken. Circumstances do not allow us to proceed with this item at this time but should occur within the next three to four weeks.

2. Signature of the applicant page is attached for the revised permit.

The total hazardous air pollutant (HAP) increase is 178 tons before controls and 43 tons after controls.

3. The single maximum HAP (glycol ethers) is identified as 178 tons per year, and will consist of the following HAPS:

Glycol Ethers
Butyl Cellosolve - CAS # 111-76-2
Hexyl Cellosolve CAS # 112-25-4
Hexyl Carbitol - CAS # 112-59-4

All HAPs calculations were completed based on existing, commercially available products.

In reviewing the original application submitted, we found no reference was made to formaldehyde emissions, which is a HAP. We now understand that formaldehyde may be produced during the coating curing process, i.e., it is a reaction product. Please note that since formaldehyde is generated as a reaction product, the manufacturers coating data may not list formaldehyde. We are currently attempting to quantify potential formaldehyde emissions. As stated previously, all process ovens will be controlled.

If additional clarification is requested, please contact me at (303) 460-5493.

Sincerely,

R. Tom Knight
Principal Environmental Engineer

# What Information is Needed from the Applicant for a Case-by-Case MACT Determination?

{REFERENCE: Federal Register / Vol. 61, No. 250 / Friday, December 27, 1996 / Rules and Regulations}

63.43 (d) Principles of MACT determinations. The following general principles shall govern preparation by the owner or operator of each permit application or other application requiring a case-by-case MACT determination concerning construction or reconstruction of a major source, and all subsequent review of and actions taken concerning such an application by the permitting authority:

(1) The MACT emission limitation or MACT requirements recommended by the applicant and approved by the permitting authority shall not be less stringent than the emission control which is achieved in practice by the best controlled similar source, as determined by the permitting authority.

(2) Based upon available information, as defined in this subpart, the MACT emission limitation and control technology (including any requirements under paragraph (d)(3) of this section) recommended by the applicant and approved by the permitting authority shall achieve the maximum degree of reduction in emissions of HAP which can be achieved by utilizing those control technologies that can be identified from the available information, taking into consideration the costs of achieving such emission reduction and any non-air quality health and environmental impacts and energy requirements associated with the emission reduction.

(3) The applicant may recommend a specific design, equipment, work practice, or operational standard, or a combination thereof, and the permitting authority may approve such a standard if the permitting authority specifically determines that it is not feasible to prescribe or enforce an emission limitation under the criteria set forth in section 112(h)(2) of the Act.

(4) If the Administrator has either proposed a relevant emission standard pursuant to section 112(d) or section 112(h) of the Act or adopted a presumptive MACT determination for the source category which includes the constructed or reconstructed major source, then the MACT requirements applied to the constructed or reconstructed major source shall have considered those MACT emission limitations and requirements of the proposed standard or presumptive MACT determination.

(e) Application requirements for a case-by-case MACT determination.

(1) An application for a MACT determination (whether a permit application under title V of the Act, an application for a Notice of MACT Approval, or other document specified by the permitting authority under paragraph (c)(2)(ii) of this section) shall specify a control technology selected by the owner or operator that, if properly operated and maintained, will meet the MACT emission limitation or standard as determined according to the principles set forth in paragraph (d) of this section.

(2) In each instance where a constructed or reconstructed major source would require additional control technology or a change in control technology, the application for a MACT determination shall contain the following information:

(i) The name and address (physical location) of the major source to be constructed or reconstructed;

(ii) A brief description of the major source to be constructed or reconstructed and identification of any listed source category or categories in which it is included;

(iii) The expected commencement date for the construction or reconstruction of the major source;

(iv) The expected completion date for construction or reconstruction of the major source;

(v) the anticipated date of start-up for the constructed or reconstructed major source;

(vi) The HAP emitted by the constructed or reconstructed major source, and the estimated emission rate for each such HAP, to the extent this information is needed by the permitting authority to determine MACT;

(vii) Any federally enforceable emission limitations applicable to the constructed or reconstructed major source;

(viii) The maximum and expected utilization of capacity of the constructed or reconstructed major source, and the associated uncontrolled emission rates for that source, to the extent this information is needed by the permitting authority to determine MACT;

(ix) The controlled emissions for the constructed or reconstructed major source in tons/yr at expected and maximum utilization of capacity, to the extent this information is needed by the permitting authority to determine MACT;

(x) A recommended emission limitation for the constructed or reconstructed major source consistent with the principles set forth in paragraph (d) of this section;

(xi) The selected control technology to meet the recommended MACT emission limitation, including technical information on the design, operation, size, estimated control efficiency of the control technology (and the manufacturer's name, address, telephone number, and relevant specifications and drawings, if requested by the permitting authority);

(xii) Supporting documentation including identification of alternative control technologies considered by the applicant to meet the emission limitation, and analysis of cost and non-air quality health environmental impacts or energy requirements for the selected control technology; and

(xiii) Any other relevant information required pursuant to subpart A.

(3) In each instance where the owner or operator contends that a constructed or reconstructed major source will be in compliance, upon startup, with case-by-case MACT under this subpart without a change in control technology, the application for a MACT determination shall contain the following information:

(i) The information described in paragraphs (e)(2)(i) through (e)(2)(x) of this section; and

(ii) Documentation of the control technology in place.
