2600 Blair Stone Rd.  
Tallahassee, FL 32399-2400

Subject: Cargill Fertilizer, Inc. - Bartow #4 DAP Plant  
PSD Permit Application

Dear Mr. Fancy,

Please find enclosed four copies of a PSD/Construction Permit application along with a check in the amount of \$7,500 (Check #162747) for the processing fee.

This application requests an increase in the allowable production rate of our No. 4 Ammoniated Phosphate Manufacturing plant located at our Bartow facility. Note that the application includes calculations of emissions associated with fuel combustion in the product dryer. The analysis is based on the worst case emissions of combustion of either the primary natural gas fuel or the No. 6 fuel oil used for back-up. However, we request that the permit be issued to also allow utilization of other, less polluting, grades of fuel (Nos. 2, 4 or 5) as back-up.

Should you have any questions, or require additional information, please feel free to contact me at 813/534-9613.

Sincerely,

David B. Jellerson, P.E.  
Environmental Superintendent

APPLICATION TO OPERATE/CONSTRUCT AIR POLLUTION SOURCES

SOURCE TYPE: Phosphate Fertilizer Production [ ] New<sup>1</sup> [x] Existing<sup>1</sup>  
APPLICATION TYPE: [x] Construction [ ] Operation [x] Modification  
COMPANY NAME: Cargill Fertilizer, Inc. COUNTY: Polk

Identify the specific emission point source(s) addressed in this application (i.e., Lime Kiln No. 4 with Venturi Scrubber; Peaking Unit No. 2, Gas Fired) No. 4 Fertilizer Plant  
SOURCE LOCATION: Street 1 mile North of SR 60 City 3 miles West of Bartow

UTM: East 17-409.5 North 3086.8  
Latitude 27° 54' 22" N Longitude 81° 54' 59" W

APPLICANT NAME AND TITLE: David B. Jellerson, Environmental Superintendent  
APPLICANT ADDRESS: P.O. Box 471, Bartow, FL 33830

SECTION I: STATEMENTS BY APPLICANT AND ENGINEER

A. APPLICANT

I am the undersigned owner or authorized representative\* of Cargill Fertilizer, Inc.

I certify that the statements made in this application for a construction permit are true, correct and complete to the best of my knowledge and belief. Further, I agree to maintain and operate the pollution control source and pollution control facilities in such a manner as to comply with the provision of Chapter 403, Florida Statutes, and all the rules and regulations of the department and revisions thereof. I also understand that a permit, if granted by the department, will be non-transferable and I will promptly notify the department upon sale or legal transfer of the permitted establishment.

\*Attach letter of authorization

Signed: David B. Jellerson  
David B. Jellerson, Environmental Superintendent  
Name and Title (Please Type)

Date: 3/1/94 Telephone No. (813) 534-9613

B. PROFESSIONAL ENGINEER REGISTERED IN FLORIDA (where required by Chapter 471, F.S.)  
This is to certify that the engineering features of this pollution control project have been designed/examined by me and found to be in conformity with modern engineering principles applicable to the treatment and disposal of pollutants characterized in the permit application. There is reasonable assurance, in my professional judgment, that

<sup>1</sup>See Florida Administration Code Rule 17-2.100(57) and (104)

the pollution control facilities, when properly maintained and operated, will discharge an effluent that complies with all applicable statutes of the State of Florida and the rules and regulations of the department. It is also agreed that the undersigned will furnish, if authorized by the owner, the applicant a set of instructions for the proper maintenance and operation of the pollution control facilities and, if applicable, pollution sources.

Signed David A. Buff

David A. Buff

Name (Please Type)

KBN Engineering and Applied Sciences, Inc.

Company Name (Please Type)

1034 NW 57th St., Gainesville, FL 32605

Mailing Address (Please Type)

Florida Registration No. 19011 Date: 2/24/94 Telephone No. (904) 331-9000

SECTION II: GENERAL PROJECT INFORMATION

- A. Describe the nature and extent of the project. Refer to pollution control equipment, and expected improvements in source performance as a result of installation. State whether the project will result in full compliance. Attach additional sheet if necessary.

See PSD Report

- B. Schedule of project covered in this application (Construction Permit Application Only)

Start of Construction Upon permit issuance Completion of Construction N/A

- C. Costs of pollution control system(s): (Note: Show breakdown of estimated costs only for individual components/units of the project serving pollution control purposes. Information on actual costs shall be furnished with the application for operation permit.)

Pollution control equipment already in place

- D. Indicate any previous DER permits, orders and notices associated with the emission point, including permit issuance and expiration dates.

A053-167639 issued 11/17/89 expires 10/16/94

E. Requested permitted equipment operating time: hrs/day 24; days/wk 7; wks/yr 52;  
If power plant, hrs/yr \_\_\_\_\_; if seasonal, describe: Maximum 8,500 hr/yr

F. If this is a new source or major modification, answer the following questions.  
(Yes or No)

1. Is this source in a non-attainment area for a particular pollutant? No
  - a. If yes, has "offset" been applied? \_\_\_\_\_
  - b. If yes, has "Lowest Achievable Emission Rate" been applied? \_\_\_\_\_
  - c. If yes, list non-attainment pollutants. \_\_\_\_\_
2. Does best available control technology (BACT) apply to this source?  
If yes, see Section VI. Yes
3. Does the State "Prevention of Significant Deterioration" (PSD)  
requirement apply to this source? If yes, see Sections VI and VII. Yes
4. Do "Standards of Performance for New Stationary Sources" (NSPS)  
apply to this source? Yes
5. Do "National Emission Standards for Hazardous Air Pollutants"  
(NESHAP) apply to this source? No
- H. Do "Reasonably Available Control Technology" (RACT) requirements apply  
to this source? No
  - a. If yes, for what pollutants? \_\_\_\_\_
  - b. If yes, in addition to the information required in this form, any information  
requested in Rule 17-2.650 must be submitted.

Attach all supportive information related to any answer of "Yes". Attach any  
justification for any answer of "No" that might be considered questionable.

# SECTION III: AIR POLLUTION SOURCES & CONTROL DEVICES (Other than Incinerators)

## A. Raw Materials and Chemicals Used in your Process, if applicable:

| Description                        | Contaminants     |            | Utilization<br>Rate - lbs/hr   | Relate to Flow Diagram |

☐ Other (specify) \_\_\_\_\_

Brief description of operating characteristics of control devices: \_\_\_\_\_

Ultimate disposal of any effluent other than that emitted from the stack (scrubber water, ash, etc.):

NOTE: Items 2, 3, 4, 6, 7, 8, and 10 in Section V must be included where applicable.

#### SECTION V: SUPPLEMENTAL REQUIREMENTS

Please provide the following supplements where required for this application.

1. Total process input rate and product weight -- show derivation [Rule 17-2.100(127)]
2. To a construction application, attach basis of emission estimate (e.g., design calculations, design drawings, pertinent manufacturer's test data, etc.) and attach proposed methods (e.g., FR Part 60 Methods, 1, 2, 3, 4, 5) to show proof of compliance with applicable standards. To an operation application, attach test results or methods used to show proof of compliance. Information provided when applying for an operation permit from a construction permit shall be indicative of the time at which the test was made.
3. Attach basis of potential discharge (e.g., emission factor, that is, AP42 test).
4. With construction permit application, include design details for all air pollution control systems (e.g., for baghouse include cloth to air ratio; for scrubber include cross-section sketch, design pressure drop, etc.)
5. With construction permit application, attach derivation of control device(s) efficiency. Include test or design data. Items 2, 3 and 5 should be consistent: actual emissions = potential (1-efficiency).
6. An 8 1/2" x 11" flow diagram which will, without revealing trade secrets, identify the individual operations and/or processes. Indicate where raw materials enter, where solid and liquid waste exit, where gaseous emissions and/or airborne particles are evolved and where finished products are obtained.
7. An 8 1/2" x 11" plot plan showing the location of the establishment, and points of airborne emissions, in relation to the surrounding area, residences and other permanent structures and roadways (Examples: Copy of relevant portion of USGS topographic map).
8. An 8 1/2" x 11" plot plan of facility showing the location of manufacturing processes and outlets for airborne emissions. Relate all flows to the flow diagram.

9. The appropriate application fee in accordance with Rule 17-4.05. The check should be made payable to the Department of Environmental Regulation.
10. With an application for operation permit, attach a Certificate of Completion of Construction indicating that the source was constructed as shown in the construction permit.

#### SECTION VI: BEST AVAILABLE CONTROL TECHNOLOGY

Attach list of emission sources. Emission data required is source name, description of point source (on NEDS point number), UTM coordinates, stack data, allowable emissions, and normal operating time.

F. Attach all other information supportive to the PSD review.

- G. Discuss the social and economic impact of the selected technology versus other applicable technologies (i.e, jobs, payroll, production, taxes, energy, etc.). Include assessment of the environmental impact of the sources.
- H. Attach scientific, engineering, and technical material, reports, publications, journals, and other competent relevant information describing the theory and application of the requested best available control technology.

## ATTACHMENT A

### 1.0 PROJECT DESCRIPTION

#### 1.1 EXISTING PROCESS

Cargill Fertilizer, Inc., currently operates a phosphate fertilizer manufacturing facility located just west of Bartow, Florida, (see Figures 1-1 and 1-2). As part of the overall manufacturing process, the No. 4 Fertilizer Plant is operated under operating permit AO53-167639. Diammonium phosphate (DAP) is manufactured by reacting phosphoric acid (at approximately 46 percent  $P_2O_5$ ) with ammonia and then granulating the resultant product (refer to flow diagram, Figure 1-3). The granulated material is then dried in a rotary dryer, screened, cooled, and sent to storage. Air pollution control equipment associated with the process is portrayed in Figure 1-4.

The maximum hourly DAP production rate is currently limited to 206.2 tons per hour (TPH) of DAP (99.0 TPH of 100 percent  $P_2O_5$ ) by permit condition based on the December 14, 1991 stack test. This stack test was conducted at a production rate of 90.0 TPH of  $P_2O_5$ . The operating permit allows the tested rate to be exceeded by up to 10 percent without requiring a new stack test. If the permitted capacity is exceeded by more than 10 percent, a compliance test must be performed within 30 days of achieving the higher rate. The maximum annual DAP production rate is limited by specific condition to 1,300,000 tons per year (TPY). The current permitted rates for the No. 4 Fertilizer Plant are summarized in Table 1-1.

#### 1.2 PROPOSED PROJECT

Cargill is proposing to increase the maximum production rate of the existing No. 4 Fertilizer Plant to a new maximum rate of 255.319 TPH of DAP (120.000 TPH of 100 percent  $P_2O_5$  input). The maximum annual DAP production rate will be increased to 2,170,212 TPY of DAP (1,020,000 TPY of 100 percent  $P_2O_5$ ), based on a maximum of 8,500 hr/yr of operation. No physical modifications to the process equipment will be associated with the higher production rates. All process and air pollution control equipment is already in place in the existing No. 4 Fertilizer Plant. The proposed maximum operating rates for the No. 4 Fertilizer Plant are summarized in Table 1-1.

| Hours of Operation     | 8,760 hr/yr                                   | 8,500 hr/yr                                    |

\* Basis: AO53-167639 and December 14, 1992, stack test (10% above rate during test).

### 1.3 EFFECT ON RELATED PROCESS EQUIPMENT

Other equipment that may be affected by the proposed No. 4 Fertilizer Plant production rate increase are described below. In each case, the effect upon the process unit is also described.

1. Wet Rock Handling--The usage of wet phosphate rock will increase proportionately to the increase in DAP production. However, there are no emissions associated with the handling of wet rock due to the wet nature of the rock.
2. No. 3 and No. 4 Phosphoric Acid Plants--The usage of phosphoric acid in the No. 4 Fertilizer Plant will increase in proportion to the increase in DAP production rate. The maximum DAP production rate is increasing by approximately 20 TPH of 100 percent  $P_2O_5$  input over the current maximum hourly production rate of 99 TPH of  $P_2O_5$ . However, in 1993, the "X" and "Y" GTSP plants at Cargill were shut down. Each of these plants was permitted to produce 28 TPH of 100 percent  $P_2O_5$ , or a total of 56 TPH of 100 percent  $P_2O_5$ . As a result of these shutdowns, overall phosphoric acid production at the Cargill facility will not increase.
3. DAP Shipping--Cargill recently submitted a permit application to increase the production rate for the No. 4 DAP product shipping unit. The requested process rate for the shipping unit is 660 TPH and 1,750,00 TPY of DAP. The baseline and maximum future particulate matter (PM) emissions for this change are considered in the PSD source applicability analysis presented in Section 3.0. The 1,750,000 TPY loading rate will not be exceeded in the future without obtaining a further permit revision.

### 1.4 EMISSION ESTIMATES

#### 1.4.1 Particulate Matter

The current permitted level of PM emissions for the No. 4 Fertilizer Plant is 0.5 pound per ton of  $P_2O_5$  input, 29.9 lb/hr, and 98.0 TPY. At the proposed higher production rate of 255.319 TPH of DAP (120.0 TPH of 100 percent  $P_2O_5$  input) and 2,170,212 TPY of DAP (1,020,000 TPY of 100 percent  $P_2O_5$  at 47 percent  $P_2O_5$  content), Cargill is proposing allowable emissions of 0.5 lb/ton  $P_2O_5$  input, not to exceed 32.0 lb/hr and 136.0 TPY. The current and proposed rates are shown in Table 1-2.

Table 1-2. Comparison of Current and Proposed Maximum Permitted Emission Rates, No. 4 Fertilizer Plant

| Pollutant                     | Current Permitted or Maximum*                 |       |       | Proposed Permitted or Maximum                 |       |       |
|-------------------------------|---|-------|-------|---|-------|-------|
|                               | lb/ton<br>P <sub>2</sub> O <sub>5</sub> Input | lb/hr | TPY   | lb/ton<br>P <sub>2</sub> O <sub>5</sub> Input | lb/hr | TPY   |
| Particulate Matter            | 0.5   | 29.9  | 98.0  | 0.5   | 32.0  | 136.0 |
| Fluorides                     | 0.06  | 3.6   | 11.8  | 0.06  | 5.5   | 23.38 |
| Sulfur Dioxide                | 0.7   | 41.9  | 122.5 | —   | 100.5 | 37.8  |
| Nitrogen Oxides               | —   | 14.7  | 64.4  | —   | 14.7  | 27.2  |
| Carbon Monoxide               | —   | 1.40  | 6.1   | —   | 1.40  | 6.0   |
| Volatile Organic<br>Compounds | —   | 0.34  | 1.5   | —   | 0.34  | 0.6   |

\* Basis: AO53-167639 and AP-42 emission factors.

#### 1.4.2 Fluorides

The current allowable fluoride emission limit for the No. 4 Fertilizer Plant is 0.06 lb/ton  $P_2O_5$  input, 3.6 lb/hr, and 11.8 TPY. At the proposed higher production rate, Cargill is proposing allowable fluoride emissions of 0.06 lb/ton  $P_2O_5$  input, not to exceed 5.50 lb/hr, and 23.38 TPY. The current and proposed rates are shown in Table 1-2.

#### 1.4.3 Emissions Due To Fuel Burning

Products of combustion are generated from natural-gas and fuel oil burning used to supply heat to the process dryer. The maximum heat input to the dryer is  $40 \times 10^6$  British thermal units per hour (MMBtu/hr), resulting in a maximum natural gas consumption of 40,000 standard cubic feet per hour (scfh) and a maximum No. 6 fuel oil consumption of 266.7 gal/hr. No. 6 fuel oil will be used as a backup fuel, and consumption will be limited to no more than 200,000 gal/yr. Emissions of sulfur dioxide ( $SO_2$ ), nitrogen oxides ( $NO_x$ ), carbon monoxide (CO), and volatile organic compounds (VOCs) are based on AP-42 emission factors (see Appendix A):

##### Natural Gas

$$SO_2: 40,000 \text{ scfh} \times 0.6 \text{ lb}/10^6 \text{ scf} = 0.024 \text{ lb/hr}$$

$$0.024 \text{ lb/hr} \times 8,500 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 0.10 \text{ TPY}$$

$$NO_x: 40,000 \text{ scfh} \times 140 \text{ lb}/10^6 \text{ scf} = 5.60 \text{ lb/hr}$$

$$5.60 \text{ lb/hr} \times 8,500 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 23.8 \text{ TPY}$$

$$CO: 40,000 \text{ scfh} \times 35 \text{ lb}/10^6 \text{ scf} = 1.40 \text{ lb/hr}$$

$$1.40 \text{ lb/hr} \times 8,500 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 6.0 \text{ TPY}$$

$$VOC: 40,000 \text{ scfh} \times 2.8 \text{ lb}/10^6 \text{ scf} = 0.11 \text{ lb/hr}$$

$$0.11 \text{ lb/hr} \times 8,500 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 0.47 \text{ TPY}$$

##### No. 6 Fuel Oil

$$SO_2: 266.7 \text{ gal/hr} \times (157 \times 2.4) \text{ lb}/1000 \text{ gal} = 100.5 \text{ lb/hr}$$

Maximum annual fuel oil consumption will be limited to 200,000 gal/yr. This is equivalent to 750 hr/yr at the maximum fuel oil consumption rate of 266.7 gal/hr.

$$100.5 \text{ lb/hr} \times 750 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 37.7 \text{ TPY}$$

$$NO_x: 266.7 \text{ gal/hr} \times 55 \text{ lb}/1000 \text{ gal} = 14.7 \text{ lb/hr}$$

$$14.7 \text{ lb/hr} \times 750 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 5.5 \text{ TPY}$$

$$CO: 266.7 \text{ gal/hr} \times 5 \text{ lb}/1000 \text{ gal} = 1.33 \text{ lb/hr}$$

$$1.33 \text{ lb/hr} \times 750 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 0.50 \text{ TPY}$$

$$\text{VOC: } 266.7 \text{ gal/hr} \times 1.28 \text{ lb/1000 gal} = 0.34 \text{ lb/hr}$$

$$0.34 \times 750 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 0.13 \text{ TPY}$$

Maximum Annual Emissions

$$\text{SO}_2: [(100.5 \text{ lb/hr} \times 750 \text{ hr/yr}) + (0.024 \text{ lb/hr} \times 7,750 \text{ hr/yr})] \div 2,000 \text{ lb/ton} = 37.8 \text{ TPY}$$

$$\text{NO}_x: [(14.7 \text{ lb/hr} \times 750 \text{ hr/yr}) + (5.6 \text{ lb/hr} \times 7,750 \text{ hr/yr})] \div 2,000 \text{ lb/ton} = 27.2 \text{ TPY}$$

$$\text{CO: } 1.40 \text{ lb/hr} \times 8,500 \text{ hr/yr} \div 2,000 \text{ lb/ton} = 6.0 \text{ TPY}$$

$$\text{VOC: } [(0.34 \text{ lb/hr} \times 750 \text{ hr/yr}) + (0.11 \text{ lb/hr} \times 7,750 \text{ hr/yr})] \div 2,000 \text{ lb/ton} = 0.55 \text{ TPY}$$

## **2.0 REGULATORY APPLICABILITY**

### **2.1 EMISSION LIMITING STANDARDS**

Federal New Source Performance Standards (NSPS) for phosphate fertilizer plants, 40 CFR 60, Subpart V, Diammonium Phosphate plants, limits emissions of fluorides from the No. 4 Fertilizer Plant. The NSPS is 0.06 lb/ton of equivalent  $P_2O_5$  feed to the process. The proposed limit for the No. 4 Fertilizer Plant after the proposed modification is 0.06 lb/ton  $P_2O_5$ , not to exceed 5.5 lb/hr. At the proposed maximum production rate of 120.00 TPH  $P_2O_5$ , the lb/hr emission rate is equivalent to 0.046 lb/ton  $P_2O_5$ . Therefore, the proposed allowable emission rate complies with the NSPS.

PM emissions from the No. 4 Fertilizer Plant currently are limited to 29.0 lb/hr and 0.5 lb/ton  $P_2O_5$  input. These limits were set based on the previous permit issued in 1989. The modified No. 4 Fertilizer Plant will be limited to 32.0 lb/hr and 0.5 lb/ton  $P_2O_5$ .

### **2.2 NEW SOURCE REVIEW APPLICABILITY**

The Cargill Bartow phosphate fertilizer plant is located in an area designated as attainment for all pollutants. Therefore, new source review for prevention of significant deterioration (PSD) would apply to the modification if an increase in emissions greater than the significant emission rate for any pollutant would occur as a result of the modification. Significant emission rates are defined in Table 500-2 of Rule 17-2.500, Florida Administrative Code (F.A.C.). Also considered in determining the net increase in emissions are any contemporaneous increases or decreases in emissions occurring at the facility.

Contemporaneous emission decreases at the facility consist of the shutdown of the "X" and "Y" GTSP plants. These shutdowns and associated reduction in emissions were previously quantified by Cargill (reference Attachment B). Contemporaneous increases consist of an increase in emissions for the No. 4 DAP Loading Unit (reference Attachment B).

The current baseline emissions must be established to determine if a net significant net increase will occur. The baseline emissions for the No. 4 Fertilizer Plant are listed in Table 2-1. These are based on the Annual Operating Report submitted to FDEP for 1992 and 1993 operating data.

Table 2-1. Current Baseline Emissions - No. 4 Fertilizer Plant

| Pollutant                  | 1992 | 1993  | Average |
|----------------------------|------|-------|---------|
| Particulate Matter         | 47.6 | 59.2  | 53.4    |
| Fluorides                  | 4.83 | 10.12 | 7.48    |
| Sulfur Dioxide             | 0.04 | 0.04  | 0.04    |
| Nitrogen Oxides            | 9.9  | 9.5   | 9.7     |
| Carbon Monoxide            | 2.5  | 2.4   | 2.4     |
| Volatile Organic Compounds | 0.41 | 0.40  | 0.40    |

Basis: Annual Operating Reports Submitted to FDEP.

The total net change in emissions is determined by taking the future maximum emissions, in TPY, minus the baseline emissions, plus previous contemporaneous increases in emissions, and minus previous contemporaneous decreases in emissions. This calculation is shown in Table 2-2. The net change in PM emissions as a result of the proposed modification is 62.9 TPY, which is above the PSD significant emission rate of 15 TPY. As a result, new source review applies for PM.

The net change in fluoride emissions is 2.3 TPY because of previous reductions in fluoride emissions; therefore, fluoride is not subject to new source review. Similarly, the net increase in emissions for each of the other pollutants is below the respective PSD significant emission rate level. As a result, PSD review does not apply to these pollutants.

Table 2-2. PSD Source Applicability Analysis, No. 4 Fertilizer Plant Expansion

| Pollutant                  | A<br>Baseline<br>Average 1991-1992<br>(TPY) | B<br>Proposed<br>No. 4 Fertilizer Plant<br>Emissions<br>(TPY) | C<br>Previous<br>Contemporaneous<br>Decreases<br>(TPY) | D<br>Previous<br>Contemporaneous<br>Increases<br>(TPY) | Net<br>Change<br>(B-A-C+D)<br>(TPY) | PSD<br>Significant<br>Emissions<br>(TPY) |
|----------------------------|---|---|--|--|-------------------------------------|--|
| Particulate Matter         | 53.4  | 136.0   | 49.4   | 29.7*  | 62.9                                | 15                                       |
| Fluorides                  | 7.5   | 23.4  | 13.6   | —  | 2.3                                 | 3  |
| Sulfur Dioxide             | 0.04  | 37.8  | —  | —  | 37.8                                | 40                                       |
| Nitrogen Oxides            | 9.7   | 27.2  | 12.3   | —  | 5.2                                 | 40                                       |
| Carbon Monoxide            | 2.4   | 6.0   | —  | —  | 3.6                                 | 100                                      |
| Volatile Organic Compounds | 0.40  | 0.6   | 0.05   | —  | 0.2                                 | 40                                       |

\* Associated with No. 4 DAP Loading Unit. Baseline (1991-1992) emissions were 5.1 TPY; proposed future emissions are 34.8 TPY.

### **3.0 NEW SOURCE REVIEW FOR PARTICULATE MATTER**

#### **3.1 REQUIREMENTS**

Under PSD new source review requirements, a proposed modification that results in a significant net emissions increase must undergo the following reviews:

1. Best Available Control Technology (BACT) evaluation,
2. Air quality impact analysis,
3. Ambient monitoring analysis, and
4. Additional impact analysis.

These requirements are addressed in the following sections.

#### **3.2 BACT ANALYSIS FOR PARTICULATE MATTER EMISSIONS**

The No. 4 Fertilizer Plant is an existing plant that uses cyclones and wet scrubbers to control PM emissions. Wet scrubbers typically are used in DAP plants throughout Florida where water is readily available from process ponds, and where fluoride control also is required to meet Florida or NSPS emission standards. Although dry PM controls (i.e., fabric filters) could be employed, these would not control fluoride, and an additional wet scrubbing system would have to be added.

A review was conducted of prior BACT/LAER determinations made for PM emissions from DAP plants. Three determinations were found and are summarized below.

|                  |          |            |   |          |      |
|------------------|----------|------------|---|----------|------|
| Agrico Chemical  | 1/21/81  | PSD-FL-061 | 0.50 lb/ton DAP                           | Scrubber | BACT |
| Chevron USA (WY) | 6/13/84  | CT-550     | 0.0180 gr/acf                             | Scrubber | BACT |
| W.R. Grace       | 7/1/80   | C53-24460  | 0.50 lb/ton P <sub>2</sub> O <sub>5</sub> | Scrubber | BACT |
| Cargill (Tampa)  | 11/26/91 | PSD-FL-178 | 0.19 lb/ton P <sub>2</sub> O <sub>5</sub> | Scrubber | BACT |

All four determinations employed wet venturi scrubbers. In the case of W.R. Grace (now Cargill Fertilizer-Bartow), initially BACT was required and was determined to be 0.5 lb/ton P<sub>2</sub>O<sub>5</sub>.

Subsequently, the company amended the permit to include PM offsets, and PSD for PM was no longer required, but the 0.5 lb/ton limit was retained.

Cargill's proposed PM emission rate of 0.5 lb/ton P<sub>2</sub>O<sub>5</sub>, not to exceed 32.0 lb/hr, is consistent with these previously determined BACT levels, considering the existing emission-control equipment. Cargill's proposed maximum PM emission rate of 32.0 lb/hr is equivalent to

0.27 lb/ton  $P_2O_5$  and 0.0131 gr/acf at the maximum production rate of 120 TPH  $P_2O_5$ . These PM levels are well below those previously determined as BACT.

As shown in Figure 1-4, the No. 4 Fertilizer Plant already has in place extensive PM control equipment. This includes a venturi scrubber, cyclone collector, and cross-flow scrubber for the reactor/granulator/vents gas stream; several cyclones, a venturi scrubber, and a cross-flow scrubber for the dryer gas stream; and cyclone collectors and a cross-flow scrubber for the cooler gas stream.

Actual historic PM emissions from Cargill's No. 4 Fertilizer Plant have ranged up to 22.5 lb/hr at production rates of 90 TPH  $P_2O_5$  (refer to Table 3-1). This would equate to approximately 0.25 lb/ton  $P_2O_5$ . The requested PM emissions are slightly higher than presently permitted. Considering those aspects and an adequate margin of safety to consistently demonstrate compliance, Cargill's proposed limit of 0.5 lb/ton  $P_2O_5$ , not to exceed 32.0 lb/hr, achieved by the existing wet scrubbing system, is considered as BACT.

### **3.3 AIR QUALITY IMPACT ANALYSIS FOR PARTICULATE MATTER**

#### **3.3.1 General Modeling Approach**

**Significant Impact Analysis**--The general modeling approach followed EPA and FDEP modeling guidelines for determining compliance with AAQS and PSD increments. For all criteria pollutants that are emitted in excess of the PSD significant emission rate due to a proposed project, a significant impact analysis is performed to determine whether the emission increase(s) alone will result in predicted impacts in excess of the EPA/FDER significant impact levels. If the project's impacts are above the significant impact levels, then a more detailed modeling analysis is performed. Current FDEP policies stipulate that the highest annual average and highest short-term (i.e., 24 hours or less) concentrations are to be compared to the applicable significant impact levels.

**AAQS/PSD Modeling Analysis**--For all pollutants that have a significant impact, a full impact analysis is required. In general, when 5 years of meteorological data are used, the highest annual and the highest, second-highest (HSH) short-term concentrations are to be compared to the applicable AAQS and allowable PSD increments. The HSH is calculated for a receptor field by:

1. Eliminating the highest concentration predicted at each receptor,

Table 3-1. Stack Test Results From Bartow No. 4 Fertilizer Plant, Cargill Fertilizer

| Test Date | Run  | Production Rate<br>(tons P <sub>2</sub> O <sub>5</sub> /hr) | Fluoride Emissions |   | Particulate Emissions |   |

2. Identifying the second-highest concentration at each receptor, and
3. Selecting the highest concentration among these second-highest concentrations.

This approach is consistent with air quality standards and allowable PSD increments, which permit a short-term average concentration to be exceeded once per year at each receptor.

#### Screening and Refinement Phases

To develop the maximum short-term concentrations for the proposed project, the modeling approach was divided into screening and refined phases to reduce the computation time required to perform the modeling analysis. For this study, the only difference between the two phases is the density of the receptor grid spacing employed when predicting concentrations. Concentrations are predicted for the screening phase using a coarse receptor grid and a 5-year meteorological data record.

Refinements of the maximum predicted concentrations are typically performed for the receptors of the screening receptor grid at which the highest and/or HSH concentrations occurred over the 5-year period. Generally, if the maximum concentration from other years in the screening analysis are within 10 percent of the overall maximum concentration, those other concentrations are refined as well. Typically, if the highest and HSH concentrations are in different locations, concentrations in both areas are refined.

Modeling refinements are performed for short-term averaging times by using a denser receptor grid, centered on the screening receptor to be refined. The angular spacing between radials is 2 degrees and the radial distance interval between receptors is 100 m. Annual modeling refinements employ an angular spacing between radials of 2 degrees and a distance interval from 100 to 300 m, depending on the concentration gradient in the vicinity of the screening receptor to be refined. If the maximum screening concentration is located on the plant property boundary, additional plant boundary receptors are input, spaced at a 2 degree angular interval and centered on the screening receptor. The domain of the refinement grid typically extends to all adjacent screening receptors. The air dispersion model is then executed with the refined grid for the entire year of meteorology during which the screening concentration occurred. This approach is used to ensure that a valid HSH concentration is obtained. A more detailed description of the model

used, along with the emission inventory, meteorological data, and screening receptor grids used in the analysis, are presented in the following sections.

**Model Selection**—The selection of an appropriate air dispersion model was based on the model's ability to simulate impacts in areas surrounding the Cargill site. Within 50 km of the site, the terrain can be described as simple, i.e., flat to gently rolling. As defined in EPA modeling guidelines, simple terrain is considered to be an area where the terrain features are all lower in elevation than the top of the stack(s) under evaluation. Therefore, a simple terrain model was selected to predict maximum ground-level concentrations.

The Industrial Source Complex Short-term (ISCST2, Version 92062) dispersion model (EPA, 1992b) was used to evaluate the pollutant emissions from the proposed facility. This model is contained in EPA's User's Network for Applied Modeling of Air Pollution (UNAMAP), Version 6 (EPA, 1988b). The ISCST2 model is applicable to sources located in either flat or rolling terrain where terrain heights do not exceed stack heights. The ISCST2 model is designed to calculate hourly concentrations based on hourly meteorological parameters (i.e., wind direction, wind speed, atmospheric stability, ambient temperature, and mixing heights). The hourly concentrations are processed into non-overlapping, short-term and annual averaging periods. For example, a 24-hour average concentration is based on 24 1-hour averages calculated from midnight to midnight of each day. For each short-term averaging period selected, the highest and second-highest average concentrations are calculated for each receptor. As an option, a table of the 50 highest concentrations over the entire field of receptors can be produced.

Major features of the ISCST2 model are presented in Table 3-2. The ISCST2 model has both rural and urban mode options which affect the wind speed profile exponent law, dispersion rates, and mixing-height formulations used in calculating ground level concentrations. The criteria used to determine when the rural or urban mode is appropriate are based on land use near the source's surroundings (Auer, 1978). If the land use is classified as heavy industrial, light-moderate industrial, commercial, or compact residential for more than 50 percent of the area within a 3-km radius circle centered on the site location, the urban option should be selected. Otherwise, the rural option is more appropriate. For the Cargill Bartow facility, the rural option was selected due to the lack of industrial development within 3 km of the plant.

Table 3-2. Major Features of the ISCST2 Model

Note: ISCST2 = Industrial Source Complex Short-Term.

Source: EPA, 1992b.

In this analysis, the EPA regulatory default options were used to predict all maximum impacts.

The regulatory default options include:

1. Final plume rise at all receptor locations,
2. Stack-tip downwash,
3. Buoyancy-induced dispersion,
4. Default wind speed profile coefficients for rural or urban option,
5. Default vertical potential temperature gradients,
6. Calm wind processing, and
7. Reducing calculated SO<sub>2</sub> concentrations in urban areas by using a decay half-life of 4 hours.

**Meteorological Data**--Meteorological data used in the ISCST2 model to determine air quality impacts consisted of a concurrent 5-year period of hourly surface weather observations and twice-daily upper air soundings from the National Weather Service (NWS) stations at Tampa International Airport and Ruskin, respectively. The 5-year period of meteorological data was from 1982 through 1986. The NWS station at Tampa International Airport, located approximately 70 km to the west of the Cargill plant site, was selected for use in the study because it is the closest primary weather station to the study area which is representative of the plant site. The surface observations included wind direction, wind speed, temperature, cloud cover, and cloud ceiling.

The wind speed, cloud cover, and cloud ceiling values were used in the ISCST2 meteorological preprocessor program, RAMMET, to determine atmospheric stability using the Turner stability scheme. Based on the temperature measurements at morning and afternoon, mixing heights were calculated with the radiosonde data using the Holzworth approach (1972). Hourly mixing heights were derived from the morning and afternoon mixing heights using the interpolation method developed by EPA (Holzworth, 1972). The hourly surface data and mixing heights were used to develop a sequential series of hourly meteorological data (i.e., wind direction, wind speed, temperature, stability, and mixing heights). Because the observed hourly wind directions were classified into one of 36 10-degree sectors, the wind directions were randomized within each sector to account for the expected variability in air flow.

### **3.3.2 Cargill Emission Inventory**

The Cargill PM emission data for the No. 4 Fertilizer Plant is presented in Table 3-3. Stack data were obtained from current operating permits and stack test data. Current PM emission rates and operating parameters for the No. 4 Fertilizer Plant were derived from the compliance test results representing the highest short-term production and emission rate over the last 2 years. Future operating conditions are based on a maximum production rate of 120 TPH  $P_2O_5$  and a maximum of 32.0 lb/hr of PM emitted.

In order to determine the PM significant impact area, the current and future operating conditions of the No. 4 Fertilizer Plant were modeled to determine the net air quality change due to the proposed production rate increase.

Modeling of the existing and future PM emissions from the No. 4 Fertilizer Plant demonstrated that the proposed production rate increase would not have a significant impact within a distance of 10 km from the Cargill facility. Therefore, a full impact analysis for PM is not required.

### **3.3.3 Receptor Locations**

**Significant Impact Analysis**--To determine the PM significant impact area, concentrations were predicted for a total of 432 receptors located in a radial grid centered on No. 4 Fertilizer Plant stack. Two hundred sixteen regular grid receptors were located in "rings" with 36 receptors per ring, spaced at 10° intervals and at distances of 5, 6, 7, 8, 9, and 10 km from the No. 4 Fertilizer Plant stack location. In addition, 216 discrete receptors were placed at 10° intervals along the plant property boundary and beyond at distances of 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, and 4.5 km (see Table 3-4).

**Class I Impact Assessment**--The Chassahowitzka National Wilderness Area (NWA) is a PSD Class I Area and is located approximately 105 km north-northwest of the Cargill site. Maximum PM impacts for the Chassahowitzka NWA were predicted at 13 discrete receptors located along the border of the Class I area. Impacts for the proposed modification only were compared to the Class I significance levels recommended by the National Park Service (NPS). A listing of Class I receptors is provided in Table 3-5.

| 331.5           | 3,183.4    |

Note: UTM coordinates of Cargill Bartow No. 4 Fertilizer Plant: 409.5 km E, 3086.8 km N.

### **3.3.4 Building Downwash Effects**

The procedures used for addressing the effects of building downwash are those recommended in the ISC Dispersion Model User's Guide. The building height, length, and width are input to the model, which uses these parameters to modify the dispersion parameters. For short stacks (i.e., physical stack height is less than  $H_b + 0.5 L_b$ , where  $H_b$  is the building height and  $L_b$  is the lesser of the building height or projected width), the Schulman and Scire (1980) method is used. If this method is used, then direction-specific building dimensions are input for  $H_b$  and  $L_b$  for 36 radial directions, with each direction representing a 10 degree sector. The features of the Schulman and Scire method are as follows:

1. Reduced plume rise as a result of initial plume dilution,
2. Enhanced plume spread as a linear function of the effective plume height, and
3. Specification of building dimensions as a function of wind direction.

For cases where the physical stack is greater than  $H_b + 0.5 L_b$  but less than GEP, the Huber-Snyder (1976) method is used. For both downwash methods, the ISCST model uses direction-specific building dimensions for  $H_b$  and  $L_b$  for 36 radial directions, with each direction representing a 10-degree sector.

The building dimensions for the No. 4 Fertilizer Plant considered in the modeling analysis are presented in Table 3-6. Although other building structures were considered, the No. 4 Fertilizer Plant stack is influenced exclusively by the No. 4 Fertilizer Plant building.

### **3.3.5 Model Results**

**Significant Impact Analysis**--A summary of the maximum PM concentrations predicted for the proposed modification only in the screening analysis is presented in Table 3-7. These results indicate the proposed increase in PM emissions from the No. 4 Fertilizer Plant will result in low ambient impacts and are less than the significant impact levels. The maximum annual and 24-hour concentrations for the averaging period are 0.11 and 2.74  $\mu\text{g}/\text{m}^3$ , which are less than the significance levels of 1 and 5  $\mu\text{g}/\text{m}^3$ , respectively. Because the proposed increase in PM emissions results in ambient concentrations less than the significant impact levels, a full impact analysis for PM is not required.

Table 3-6. Building Dimensions Used in the Modeling Analysis for Cargill Sources

Note: YY = Year, MM = Month, DD = Day, HH = Hour.

\* All receptor coordinates are reported with respect to the No. 4 Fertilizer Plant stack location.

**PSD Class I Analysis**--Maximum PM concentrations predicted at the PSD Class I area of the Chassahowitzka NWA for comparison to the NPS recommended Class I significance values are presented in Table 3-8. These concentrations are predicted for the proposed No. 4 Fertilizer Plant modification only. The maximum predicted impacts are 0.033 and 0.0013  $\mu\text{g}/\text{m}^3$  for the 24-hour and annual averaging periods, respectively. These impacts are well below the NPS significance levels for both averaging periods. Therefore, a more extensive PSD Class I modeling analysis was not required.

### 3.4 AMBIENT MONITORING ANALYSIS

The PSD *de minimis* monitoring concentration for PM is 10 $\mu\text{g}/\text{m}^3$ , 24-hour average. Since the predicted increase in PM impacts (2.7  $\mu\text{g}/\text{m}^3$ , 24-hour maximum) is less than the *de minimis* concentration level, the project can be exempted from preconstruction ambient monitoring requirements.

### 3.5 ADDITIONAL IMPACT ANALYSIS

#### 3.5.1 Introduction

An air quality related values (AQRV) analysis was performed to assess potential incremental and cumulative impacts on vegetation, soils, wildlife, and visibility in the Chassahowitzka NWA PSD Class I area. This AQRV analysis was performed for PM because this pollutant is emitted in quantities exceeding the PSD significant emission rate. PSD regulations specifically provide for the use of atmospheric dispersion models in performing AQRV analyses. Guidance for the use and application of dispersion models is presented in the EPA publication Guideline on Air Quality Models, Revised (EPA, 1993).

The Industrial Source Complex Short Term (ISCST2 Version 93109) model was used to determine potential air quality impacts for this analysis. All air dispersion methodologies used for the AQRV analysis are the same as those used in the air quality impact assessment for the Class I area (see Section 3.3).

The current and future operating conditions of the No. 4 Fertilizer Plant were modeled to determine the net air quality change in the Chassahowitzka NWA Class I area due to the proposed production rate increase. These results were presented in Section 3.3 and Table 3-8. Cumulative Class I impacts were developed from the most recently available (i.e., 1991 and 1992) PM

Table 3-8. Maximum Predicted Concentrations for the Proposed Modification Only at the Chassahowitzka Wilderness Area

Note: YY=Year, MM=Month, DD=Day, HH=Hour.

\* All receptor coordinates are reported in Universal Transverse Mercator (UTM) Coordinates.

monitoring data collected near the Class I area. These data were used to represent existing background values near the Chassahowitzka NWA. The incremental impacts due to the proposed increase were added to the background values in order to develop a cumulative impact for use in the AQRV analysis.

A summary of the available monitoring data for PM is included in Table 3-9. The nearest monitor to the Class I area is located at the Twin Rivers Marina, approximately 9 miles north of the Class I area. The highest values for any monitor were taken as the existing background values and, therefore, represents a conservative approach to the analysis. These background values were added to the proposed impacts to represent total air quality impacts at the Class I area. The predicted impacts of the proposed project ( $0.033 \mu\text{g}/\text{m}^3$ , 24-hour maximum;  $0.0013 \mu\text{g}/\text{m}^3$ , annual average) are negligible compared to the existing background values. Therefore, the background value of  $86 \mu\text{g}/\text{m}^3$ , 24-hour average, and  $33 \mu\text{g}/\text{m}^3$ , annual average, also represent the cumulative PM concentrations including the proposed project. These cumulative impacts are shown in Table 3-10.

### **3.5.2 Identification of AQRVs and Methodology**

An AQRV analysis was conducted to assess the potential risk to AQRVs of the Chassahowitzka NWA due to the proposed increase from the Cargill Bartow facility. The U.S. Department of the Interior in 1978 administratively defined AQRVs to be:

All those values possessed by an area except those that are not affected by changes in air quality and include all those assets of an area whose vitality, significance, or integrity is dependent in some way upon the air environment. These values include visibility and those scenic, cultural, biological, and recreational resources of an area that are affected by air quality.

Important attributes of an area are those values or assets that make an area significant as a national monument, preserve, or primitive area. They are the assets that are to be preserved if the area is to achieve the purposes for which it was set aside (Federal Register 1978).

Except for visibility, AQRVs were not specifically defined. However, odor, soil, flora, fauna, cultural resources, geological features, water, and climate generally have been identified by land managers as AQRVs. Since specific AQRVs have not been identified for the Chassahowitzka NWA, this AQRV analysis evaluates the effects of air quality on general vegetation types and wildlife found in the Chassahowitzka NWA.

Table 3-9. Summary of PM Monitoring Data Collected Near the Chassahowitzka NWA

| Year | County | Station ID   | Monitor Location                               | Number of Observations | Maximum Concentrations Reported ( $\mu\text{g}/\text{m}^3$ ) |        |
|------|--------|--------------|--|------------------------|--|--------|
|      |        |              |  |                        | 24-Hour  | Annual |
| 1991 | Citrus | 0580-003-J02 | Crystal River; Twin Rivers Marina              | 60                     | 65   | 33     |

| 1992 | Citrus | 0580-005-J02 | Crystal River; East of FPC Plant               | 59                     | 69   | 24     |

<sup>a</sup> Colocated monitor.

Table 3-10. Incremental and Cumulative PM Impacts at the Class I Area

| Averaging Time | Background PM Concentration ( $\mu\text{g}/\text{m}^3$ ) | Increase Due to Proposed Project ( $\mu\text{g}/\text{m}^3$ ) | Cumulative PM Concentration with Proposed Project ( $\mu\text{g}/\text{m}^3$ ) | Primary/Secondary Ambient Air Quality Standard ( $\mu\text{g}/\text{m}^3$ ) |
|----------------|--|---|--|---|
| Annual         | 33   | 0.0013  | 33   | 50  |
| 24-hour        | 86   | 0.033   | 86   | 150   |
| 8-hour         | 151 <sup>a</sup>   | 0.11  | 151  | —   |
| 3-hour         | 194 <sup>a</sup>   | 0.18  | 194  | —   |
| 1-hour         | 215 <sup>a</sup>   | 0.32  | 215  | —   |

<sup>a</sup> Based on 24-hour concentration and recommended EPA averaging time factors:

24-hour / 1-hour = 0.4

8-hour / 1-hour = 0.7

3-hour / 1-hour = 0.9

Vegetation type AQRVs and their representative species types have been defined as:

Marshlands - black needlerush, saw grass, salt grass, and salt marsh cordgrass

Marsh Islands - cabbage palm and eastern red cedar

Estuarine Habitat - black needlerush, salt marsh cordgrass, and wax myrtle

Hardwood Swamp - red maple, red bay, sweet bay, and cabbage palm

Upland Forests - live oak, scrub oak, longleaf pine, slash pine, wax myrtle, and saw palmetto

Mangrove Swamp - red, white, and black mangrove

Wildlife AQRVs have been identified as endangered species, waterfowl, marsh and waterbirds, shorebirds, reptiles, and mammals.

A screening approach was used which compared the maximum predicted ambient concentration of air pollutants of concern in the Chassahowitzka NWA with effect threshold limits for both vegetation and wildlife as reported in the scientific literature. A literature search was conducted which specifically addressed the effects of air contaminants on plant species reported to occur in the NWA. While the literature search focused on such species as cabbage palm, eastern red cedar, lichens, and species of the hardwood swamplands and mangrove forest, no specific citations that addressed these species were found. It is recognized that effect threshold information is not available for all species found in the Chassahowitzka NWA, although studies have been performed on a few of the common species and on other similar species which can be used as models. In conducting the assessment, both direct (fumigation) and indirect (soil accumulation/uptake) exposures were considered for flora, and direct exposure (inhalation) was considered for wildlife.

### **3.5.3 Particulate Matter Exposure: Vegetation**

Although information pertaining to the effects of particulate matter on plants is scarce, some concentrations are available (Mandoli and Dubey, 1988). Ten species of native Indian plants were exposed to levels of particulate matter that ranged from 210 to 366  $\mu\text{g}/\text{m}^3$  for an 8-hour averaging period. Damage in the form of a higher leaf area/dry weight ratio was observed at varying degrees for most plants tested. Concentrations of particulate matter lower than 163  $\mu\text{g}/\text{m}^3$  did not appear to be injurious to the tested plants.

By comparison of these published toxicity values for particulate matter exposure (i.e., concentrations for an 8-hour averaging time), the possibility of plant damage in the Chassahowitzka NWA can be determined. The maximum predicted cumulative 8-hour particulate matter concentration is  $151 \mu\text{g}/\text{m}^3$ . This concentration is approximately 70 percent of the values that affected plant foliage. The contribution of the proposed project ( $0.22 \mu\text{g}/\text{m}^3$ , 8 hour) is insignificant in comparison to existing PM concentrations.

#### **3.5.4 Particulate Matter Exposure: Wildlife**

A wide range of physiological and ecological effects to fauna has been reported for particulate pollutants (Newman, 1980; Newman and Schreiber, 1988). The most severe of these effects have been observed at concentrations above the secondary ambient air quality standards ( $150 \mu\text{g}/\text{m}^3$ , 24-hour average, and  $50 \mu\text{g}/\text{m}^3$ , annual average). Physiological and behavioral effects have also been observed in experimental animals at or below these standards. However, no observable effects to fauna are expected at concentrations below the values reported in Table 3-11. As shown in Table 3-10, the cumulative concentrations of PM with the proposed project are below those that would cause respiratory stress in wildlife. The proposed project's contribution to cumulative impacts is negligible.

#### **3.5.5 Particulate Matter Exposure: Soils**

The majority of the soil in the Class I area is classified as Weekiwachee-Durbin muck. This is an euic, hyperthermic type sulfhemist that is characterized by high levels of sulfur and organic matter. This soil is flooded daily with the advent of high tide and the pH ranges between 6.1 and 7.8. The upper level of this soil may contain as much as 4 percent sulfur (USDA, 1991).

Any particulate deposition from the proposed project would be neutral or alkaline in nature. Although ground deposition was not calculated, it is evident that the effect of any dust deposited would be inconsequential in light of the existing soil pH. The regular flooding of these soils by the Gulf of Mexico regulates the pH and any change in acidity in the soil would be buffered by this activity.

Table 3-11. Examples of Reported Effects of Air Pollutants at Concentrations Below National Ambient Air Quality Standards

| Pollutant                 | Reported Effect  | Concentration<br>( $\mu\text{g}/\text{m}^3$ ) | Exposure                    |
|---------------------------|--|---|-----------------------------|
| Particulates <sup>a</sup> | Respiratory stress,<br>reduced respiratory<br>disease defenses           | 120<br>$\text{PbO}_3$                         | continually<br>for 2 months |
|                           | Decreased respiratory<br>disease defenses in<br>rats, same with hamsters | 100<br>$\text{NiCl}_2$                        | 2 hours                     |

### 3.6 IMPACTS UPON VISIBILITY

Because the Chassohowitzka NWA is located approximately 105 km to the north-northwest of the Cargill site, a visibility impact assessment of the Class I area is required. A Level I visibility screening analysis was conducted following the procedures outlined in "Workbook for Estimating Visibility Impairment" (EPA,1980). The Level I screening analysis is designed to provide a conservative estimate of plume visual impacts (i.e., impacts higher than expected). The EPA model, VISCREEN, was used for this analysis. Particulate and NO<sub>x</sub> emissions used for the calculations were based upon the total allowable emissions from the No. 4 Fertilizer Plant after the proposed production rate increase.

Model input and output results are presented in Figure 3-1. As indicated, the maximum visual impacts caused by the No. 4 Fertilizer Plant do not exceed the screening criteria inside or outside the Class I area after the proposed production rate increase.

<sup>a</sup>Boilers can be approximately classified according to their gross (higher) heat rate as shown below:Utility (power plant) boilers:  $>106 \times 10^9$  J/hr ( $>100 \times 10^6$  Btu/hr)Industrial boilers:  $10.6 \times 10^9$  to  $106 \times 10^9$  J/hr ( $10 \times 10^6$  to  $100 \times 10^6$  Btu/hr)Commercial boilers:  $0.5 \times 10^9$  to  $10.6 \times 10^9$  J/hr ( $0.5 \times 10^6$  to  $10 \times 10^6$  Btu/hr)Residential furnaces:  $<0.5 \times 10^9$  J/hr ( $<0.5 \times 10^6$  Btu/hr)<sup>b</sup>References 3-7 and 24-25. Particulate matter is defined in this section as that material collected by EPA Method 5 (front half catch).<sup>c</sup>References 1-5. S indicates that the weight % of sulfur in the oil should be multiplied by the value given.<sup>d</sup>References 3-5 and 8-10. Carbon monoxide emissions may increase by factors of 10 to 100 if the unit is improperly operated or not well maintained.<sup>e</sup>Expressed as NO<sub>2</sub>. References 1-5, 8-11, 17 and 26. Test results indicate that at least 95% by weight of NO<sub>x</sub> is NO for all boiler types except residential furnaces, where about 75% is NO.<sup>f</sup>References 18-21. Volatile organic compound emissions are generally negligible unless boiler is improperly operated or not well maintained, in which case emissions may increase by several orders of magnitude.<sup>g</sup>Particulate emission factors for residual oil combustion are, on average, a function of fuel oil grade and sulfur content:Grade 6 oil:  $1.25(S) + 0.38$  kg/10<sup>3</sup> liter [ $10(S) + 3$  lb/10<sup>3</sup> gal] where S is the weight % of sulfur in the oil. This relationship is

based on 81 individual tests and has a correlation coefficient of 0.65.

Grade 5 oil: 1.25 kg/10<sup>3</sup> liter (10 lb/10<sup>3</sup> gal)Grade 4 oil: 0.88 kg/10<sup>3</sup> liter (7 lb/10<sup>3</sup> gal)<sup>h</sup>Reference 25.<sup>i</sup>Use 5 kg/10<sup>3</sup> liters (42 lb/10<sup>3</sup> gal) for tangentially fired boilers, 12.6 kg/10<sup>3</sup> liters (105 lb/10<sup>3</sup> gal) for vertical fired boilers, and 8.0 kg/10<sup>3</sup> liters (67 lb/10<sup>3</sup> gal) for all others, at full load and normal (>15%) excess air. Several combustion modifications can be employed for NO<sub>x</sub> reduction: (1)limited excess air can reduce NO<sub>x</sub> emissions 5-20%, (2) staged combustion 20-40%, (3) using low NO<sub>x</sub> burners 20-50%, and (4) ammonia injection can reduce NO<sub>x</sub> emissions 40-70% but may increase emissions of ammonia. Combinations of these modifications have been employed for further reductions in certain boilers. See Reference 23 for a discussion of these and other NO<sub>x</sub> reducing techniques and their operational and environmental impacts.<sup>j</sup>Nitrogen oxides emissions from residual oil combustion in industrial and commercial boilers are strongly related to fuel nitrogen content, estimated more accurately by the empirical relationship: $\text{kg NO}_2/10^3 \text{ liter} = 2.75 + 50(N)^2$  [ $\text{lb NO}_2/10^3 \text{ gal} = 22 + 400(N)^2$ ] where N is the weight % of nitrogen in the oil. For residual oils having high (>0.5 weight %) nitrogen content, use 15 kg NO<sub>2</sub>/10<sup>3</sup> liter (120 lb NO<sub>2</sub>/10<sup>3</sup> gal) as an emission factor.

NA = not applicable

- Expressed as weight pollutant/volume natural gas fired.
- Based on an average natural gas higher heating value of 8270 kcal/m<sup>3</sup> (1000 Btu/scf). The emission factors in this table may be converted to other natural gas heating values by multiplying the given emission factor by the ratio of the specified heating value to this average heating value.
- Filterable PM is that particulate matter collected on or prior to the filter of an EPA Method 5 (or equivalent) sampling train.
- Condensible PM is that particulate matter collected in the impinger portion of an EPA Method 5 (or equivalent) sampling train.

NA = Not Applicable.

a. Expressed as weight pollutant/volume natural gas fired.

b. Based on an average natural gas higher heating value of 8270 kcal/m<sup>3</sup> (1000 Btu/scf). The emission factors in this table may be converted to other natural gas heating values by multiplying the given emission factor by the ratio of the specified heating value to this average heating value.

c. Reference 7. Based on average sulfur content of natural gas, 4600 g/10<sup>6</sup> Nm<sup>3</sup> (2000 gr/10<sup>6</sup> scf).

d. Expressed as NO<sub>2</sub>. For tangentially fired units, use 4400 kg/10<sup>6</sup> m<sup>3</sup> (275 lb/10<sup>6</sup> ft<sup>3</sup>). At reduced loads, multiply factor by load reduction coefficient in Figure 1.4-1. Note that NO<sub>x</sub> emissions from controlled boilers will be reduced at load conditions.

e. Emission factors apply to packaged boilers only.
