## REPORT CERTIFICATION

---

I have calculated and reviewed all data in this report, and hereby certify that the test report is authentic and accurate to the best of my knowledge.

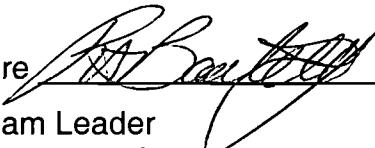

Date 7/11/2000

Signature 

QA/QC Coordinator  
Senior Environmental Technician  
Environmental Affairs  
Tampa Electric Company

The sampling and analysis performed for this report were carried out under my direction, and I hereby certify that this test report is authentic and accurate.

Date 7-11-00

Signature 

Test Team Leader  
Environmental Affairs  
Tampa Electric Company

I have reviewed the testing details and results in this report, and hereby certify that the test report is authentic and accurate to the best of my knowledge.

## **1.0 SUMMARY OF RESULTS**

---

On June 14, 2000, the Environmental Affairs, Air Services and Auditing group of Tampa Electric Company performed source emission tests on IGCC Unit No. 1 at the Polk Power Station. The combustion turbine was fired with syngas from a coal gasification system. This test was conducted to satisfy requirements in Title V permit no. 1050233-001-AV for NO<sub>x</sub> Best Available Control Technology (BACT) determinations. Testing was performed according to USEPA test methods as referenced in 40 CFR Part 60, Appendix A.

The Nitrogen Oxides (NO<sub>x</sub>) emission rate was derived from three test runs. The calculated average was 18.1 ppm corrected to 15% oxygen on a dry basis.

During the tests on June 14, 2000, Unit No. 1 Combustion Turbine was operated at an average load of 190 megawatts. Details of turbine operation are included in Appendix C.

## **2.0 SOURCE DESCRIPTION/TEST PROCEDURES**

Polk Power Station is located at County Road 630 approximately 13 miles southwest of Bartow, Polk County, Florida. Unit No. 1 is an IGCC generating unit, 192 MW capacity when fired with Syngas fuel. The source sampling location consists of a circular stack 19 ft. in diameter with four sample ports located 90° apart on the stack circumference. A diagram of the stack sampling location is included in Figure 1 and 2 along with other pertinent information on the test site.

Nitrogen Oxides sampling was performed in accordance with USEPA Reference Method 20 (40 CFR Part 60, Appendix A) "Determination of Nitrogen Oxides, Sulfur Dioxide, and Diluent Emissions from Stationary Gas Turbines". Testing was performed using a Thermo Environmental Model 10 A/R Chemiluminescent NO-NO<sub>x</sub> Gas Analyzer. Details of fuel bound nitrogen is found in Appendix B.

Diluent sampling was performed in accordance with USEPA Reference Method 3-A (40 CFR Part 60, Appendix A), "Determination of Oxygen and Carbon Dioxide concentrations in Emissions from Stationary Sources (Instrumental Analyzer Procedure)". Testing was performed using a Servomex 1400 B Oxygen Analyzer.

## TCEMS Description

The following discussion briefly outlines the operation principles of Corporate Environmental Services Transportable Continuous Emissions Monitoring System (TCEMS). Additional information on instrument operation may be found in the individual instrument manuals provided by the manufacturers. A schematic of the TCEMS set-up is presented in Figure 3.

## Servomex Model 1400 B O<sub>2</sub> Analyzer

The Servomex 1400B oxygen analyzer measures the paramagnetic susceptibility of the sample gas by means of a magneto-dynamic type measuring cell.

## Thermo Environmental Instruments Model 10A/R NO/NOx Analyzer

The Thermo Environmental Instruments model 10A/R NO/NOx analyzer automatically and continuously determines the concentration of nitric oxide (NO) and/or oxides of nitrogen (NO<sub>x</sub>) in a flowing gas mixture. The analytical technique is chemiluminescence.

To measure NO concentrations, the gas sample to be analyzed is blended with ozone (O<sub>3</sub>) in a reaction chamber. The resulting chemiluminescence activity is monitored through an optical filter by a high sensitivity photomultiplier tube positioned at one end of the chamber.

This filter and photomultiplier combination responds to light of a narrow wavelength band unique to the NO/O<sub>3</sub> reaction, producing an interference free signal. The output from the photomultiplier is linearly proportional to the NO concentration.

To measure NO<sub>x</sub> concentrations (i.e., NO plus NO<sub>2</sub>), the sample gas flow is diverted through an NO<sub>2</sub>-to-NO converter. The chemiluminescent action in the reaction chamber to the converter effluent is linearly proportional to the NO<sub>x</sub> concentration entering the converter.

### **Data Acquisition System**

The data acquisition system (DAS) developed by Entropy Environmentalists Inc. uses a portable personal computer with an internal 32 bit analog-to-digital converter with an external 16 channel multiplexer. In addition to providing an instantaneous display of analyzer responses, the DAS can average data, calculate emission rates, and document analyzer calibrations. The test results and calibrations are stored on the hard disk and printed on a dot matrix printer.

### **TCEMS Sample Handling System**

The extractive monitors utilized in the TCEMS require that the effluent stream be conditioned to eliminate any possible interference (i.e., water vapor and particulate matter), before being transported and injected into each analyzer. Figure 3 depicts a schematic of the entire sample handling system. The major components of this system are listed below:

- Gas transport tubing
- Moisture removal system
- Sampling pump

### **Gas Transport Tubing**

Two separate 1/4 inch O.D. Teflon tubes were used for the sample gas transport.

### **Moisture Removal System**

The moisture removal system was comprised of an ice bath condenser, constructed of a 30-foot section of 3/8 inch O.D. Teflon tubing wrapped in a 12-inch coil. Effluent travels through this coil and then passes, in series, through two stainless steel moisture traps where the condensate drops out and is removed via a condensate discharge pump. With the exception of the discharge pump, the entire assembly is chilled in an ice bath.

### **Sampling Pump**

The Thomas Model 2107CE20-TFE pump is used to transport the effluent sample through the conditioning system to the analyzers. All internal parts of the pump that come into contact with the gas sample are constructed of 316 stainless steel or Teflon.

## **APPENDIX D-4**

### **CONVERTER EFFICIENCY RESULTS**

ENVIRONMENTAL AFFAIRS - CAUSEWAY  
MEMORANDUM

---

TO: Quality Assurance File

FROM: R.A. Mc Darby

DATE: 15, June, 2000

SUBJECT: NO<sub>2</sub> to NO Converter Efficiency Test  
40 CFR 60, Appendix A, Method 20  
Section 5.6  
Analyzer S/N 10A/R-22525-205

---

The following results detail the performance of the converter efficiency test on analyzer S/N 10A/R-22525-205:

Highest value recorded during the 30 minute test run =	28.2 ppm
Value recorded at the end of the 30 minute test run =	28.2 ppm
Percent of decrease =	0.0 %

These results indicate that the converter currently installed in the referenced analyzer meets the requirements of 40 CFR 60, Appendix A, Reference Method 20, § 5.6.

In accordance with the instructions contained in 40 CFR 60, Appendix A, Reference Method 20, sub-section 5.6.1; A sample was prepared using gas cylinder S/N ALM-017813 (certificate attached), diluted approximately 1:1 with 20.9% purified air. The sample was introduced into the analyzer through the sample port, and allowed to run for 30 minutes (08:23 – 08:53). The results from this run are attached for reference.
