Permit No. 0570005-019-AC(PSD-FL-339)
"C" Sulfuric Acid Unit
CEMS Certifications and Compliance Test Report

Dear Mr. Smolen:

In accordance with Permit No. 0570005-019-AC(PSD-FL-339) (i.e., Section III: Emissions Units Specific Conditions 13, 14, and 15) enclosed are copies of the Sulfur Dioxide and Oxygen CEMS Certifications Test Reports for the testing conducted on our "C" Sulfuric Acid Unit on January 25 & 26, 2005. Also, enclosed is the Calibration Drift Report.

If there are any questions concerning the results, please give Michael Messina a call at (813) 364-5639..

Sincerely,

Thomas A. Edwards

1.0 INTRODUCTION

The Environmental Control Laboratory of CF Industries, Inc., Plant City Phosphate Complex, conducted relative accuracy (RA) at the "C" Unit Sulfuric Acid Plant in Plant City, Florida on January 25 & 26, 2005. Testing was performed to determine conformance with EPA Performance Specification 2 and 4.

2.0 CONTINUOUS EMISSION MONITOR DESCRIPTION

The "C" Unit Sulfuric Acid Plant is equipped with a continuous emission monitoring system (CEMS) utilizing an Ametek 4000 Photometric SO₂ analyzer. This is an extractive sampler with a range of 0 to 1000 ppm. The analyzer is equipped with an automatic zero adjustment and adjusts the zero point at one hour intervals. The plant is also equipped with a Yokogawa continuous oxygen monitoring system. This is an extractive sampler with a range of 0 to 24 percent O₂. Gas concentrations are recorded by a data acquisition system in the control room. The SO₂ and O₂ data are utilized to determine the source SO₂ emission in pound of SO₂ per ton of 100 percent sulfuric acid produced.

3.0 TEST RESULTS

Results of the SO₂ relative accuracy tests are summarized in Table 1. In order to be in conformance with Performance Specification 2, the relative accuracy of the SO₂ CEMS must be no greater than 20 percent of the mean value of the reference method test data in terms of the units of the emission standard or 10 percent of the applicable standard, whichever is greater. The relative accuracy is the absolute mean difference between the emission rate determined by the CEMS and the value determined by the reference method plus the 2.5 percent error confidence coefficient of a series of tests divided by the mean of the reference tests or the applicable emission limit. The relative accuracy of this plant, based upon the mean value of the reference method test data was 6.93 percent. The relative accuracy of the "C" Unit Sulfuric Acid Plant was therefore within the allowable limits.

Results of the O₂ relative accuracy tests are summarized in Table 2. The average difference between the reference method and the CEMS data of the nine data sets constitute the relative accuracy. In order to be in conformance with Performance Specification 3, the relative accuracy of the O₂ CEMS must be no greater than 1.0 percent O₂. The relative accuracy of the O₂ CEMS, based upon the above definition, was 0.19 percent. The relative accuracy was therefore within the allowable limits.

4.0 TEST PROCEDURES

4.1 Methods

The SO₂ relative accuracy test was conducted in accordance with Performance Specification 2 – Specifications and Test Procedures for SO₂ and NO₂ Continuous Emission Monitoring Systems in Stationary Sources, 40 CFR 60, Appendix B. The relative accuracy test procedures require that a minimum of nine sets of reference method tests be conducted. Nine sets of data were collected concurrently with the CEMS.

Relative accuracy testing was performed in conjunction with a compliance test.

Therefore, three runs were performed for a period of 60 minutes per run and six runs were performed for a period of 21 minutes per run. Reference method samples were collected and analyzed in accordance with EPA Method 8 – Determination of Sulfuric Acid Mist and Sulfur Dioxide Emissions from Stationary Sources, 40 CFR 60, Appendix A.

The O₂ relative accuracy test was conducted in accordance with Performance Specification 3 – Specifications and Test Procedures for O₂ and CO₂ Continuous Emission Monitoring Systems, 40 CFR 60, Appendix B. The relative accuracy test procedures require that a minimum of nine sets of reference method tests be conducted. Nine sets of data were collected concurrently with the O₂ CEMS. Oxygen sampling was performed simultaneously with SO₂ sampling in accordance with EPA Method 3B – Gas Analysis for the Determination of Emission Rate Correction Factor or Excess Air, 40 CFR 60, Appendix A.

4.2 Test Locations

During the three runs utilized for the EPA Method 8 compliance test, twenty four sample points were utilized. During the six runs utilized for relative accuracy only, three sample points were utilized for collecting the reference method sulfur dioxide and oxygen samples. The points were located along a measurement line that passed through the centroidal area of the stack. The three sample points were located on the line at 16.7, 50.0, and 83.3 percent of the stack diameter. Velocity traverses were performed at twenty four points during each of these runs for determination of flow rate. The locations of the sampling ports are shown in Figure 1.

4.3 Sampling Train

The sulfur dioxide sampling train consisted of a stainless steel nozzle, a Napp Corporation heated borosilicate glass-lined probe, a glass filter bypass tube, a glass fiber filter, and four impingers arranged as shown in Figure 2. The first impinger was charged with 100 milliliters of 80 percent isopropanol. The second and third impingers were each charged with 100 milliliters of 3 percent hydrogen peroxide and the fourth impinger charged with indicating silica gel desiccant. The impingers were cooled in an ice and water bath during sampling. A Lear Siegler control console was used to monitor the gas flow rates and stack conditions during sampling.

The oxygen sampling train consisted of a stainless steel probe, sample line, pump, and tedlar sampling bag as shown in Figure 3.

4.4 Sample Collection

Prior to sulfur dioxide sampling, the pitot tubes were checked for leaks and the manometers were zeroed. A pretest leak check of the sample line was conducted by sealing the nozzle and applying a 15" vacuum. A leak rate of less than 0.02 cubic feet per minute (CFM) was considered acceptable.

4.5 Sample Recovery

A post test leak check of the sulfur dioxide sampling train was performed at the completion of the run by sealing the nozzle and applying a vacuum equal to or greater than the maximum value reached during the sample run. A leak rate of less than 0.02 CFM or 4 percent of the average sampling rate (whichever is less) was considered acceptable. The probe was then disconnected, the ice bath drained, and the remaining part of the sample train was purged by drawing air through the system for fifteen minutes at the average flow rate used during sampling. The second and third impingers, associated connecting glassware, and back half of the filter holder were rinsed with distilled, deionized water into a 500 milliliter volumetric flask.

5.0 Analytical Procedure

5.1 Pretest Preparation

The 3 percent hydrogen peroxide solution was prepared from 30 percent reagent grade hydrogen peroxide and deionized water on the morning of the test. The 80 percent isopropanol solution was prepared from 100 percent reagent grade isopropanol and deionized water. The impingers were charged as described in section 4.3.

5.2 Analysis

After recovery, the samples were analyzed using procedures outline in EPA Method 8 - Determination of Sulfuric Acid Mist and Sulfur Dioxide Emissions from Stationary Sources, 40 CFR 60, Appendix A. Duplicate results were obtained in milliliters of barium perchlorate titrant. The average of these titration values were used to compute the sulfur dioxide concentrations.

Table 1. SULFUR DIOXIDE RELATIVE ACCURACY TEST RESULTS

| Average | | | 336 | 355 | 19.4 |

Std. Dev. 4.978

2.5% Error Confidence Coefficient (CC)= t0.975*Sd/sq.rt. N

CC = 3.816

n = 9

t_{0.975} = 2.3 for n = 9

Relative Accuracy (RA) = (mean of difference) + CC/Avg RM

RA = 6.93 %

In order to be in conformance with Performance Specification 2, the relative accuracy of the SO₂ CEMS must be no greater than 20 percent of the mean value of the reference method test data in terms of the units of the emission standard or 10 percent of the applicable standard, whichever is greater.

The relative accuracy of this plant based upon the mean value of the reference method test data was 6.93%. The relative accuracy of C SAP was therefore within the allowable limits.

Lbs SO2/ton H2SO4 : ppm SO2 X .001959
0.265 - (.0126 X % O2)

To Calculate Lbs/ Ton:

- 1) Multiply the hourly average ppm SO2 (from the log sheet) by .001959
- 2) Multiply the hourly average % O2 (from the log sheet) by .0126
- 3) Subtract the number calculated in step two (b) from .265
- 4) Divide the number calculated in step one (a) by the number calculated in step three (c).

This will give Lbs/ Ton H2SO4

Re: Meter Box Calibration &
Dry Gas Meter Calibration

Dear Mike:

The attached calibrations were performed on the Lear Seigler control box (serial # C254) and Rockwell dry gas meter (serial # JA631105). All calibrations were performed using a wet test meter that is checked annually using a liquid displacement method as described in "Quality Assurance Handbook for Air Pollution Measurement Systems: Volume III, Stationary Source Specific Methods". A copy of the calibration check is enclosed.

Please let me know if we can be of any further assistance.

Very truly yours,

SOUTHERN ENVIRONMENTAL
SCIENCES, INC.

Mark S. Gierke

CALIBRATION DRIFT EVALUATION

The CF Industries, Inc., Instrument Shop tests the calibration of the SO₂ and O₂ Continuous Emissions Monitoring Systems (CEMS) against certified reference gases daily. Tables 1 and 2 show calibration drift test results for Sulfuric Acid Plant C for the period, January 23 through January 29, 2005. Both the SO₂ and O₂ calibration drift results are within the rule specification ranges.

Attachment 1 provides the CEMS Calibration Test Log for the month of January 2005. Attachment 2 provided zero point drift data for the SO₂ and O₂ CEMS.

T.A. Edwards
3/4/2005

Table 1
Calibration Drift Determination - "C" Sulfuric Acid Plant
January 23 - January 29, 2005 - SO₂ CEMS

| Date | Reference Value ppm (a) | CEMS Response ppm | Calibration Drift ppm | Calibration Drift, % of span value (b) |
|-----------|----------------------------|----------------------|--------------------------|-------------------------------------------|
| 23-Jan-05 | 904 | 897.0 | 7 | 0.77 |
| 24-Jan-05 | 904 | 910.0 | 6 | 0.66 |
| 25-Jan-05 | 904 | 900.0 | 4 | 0.44 |
| 26-Jan-05 | 904 | 896.0 | 8 | 0.88 |
| 27-Jan-05 | 904 | 893.0 | 11 | 1.22 |
| 28-Jan-05 | 904 | 899.0 | 5 | 0.55 |
| 29-Jan-05 | 904 | 898.0 | 6 | 0.66 |

(a) The zero point is checked daily against the certified SO₂ reference gas (0 ppm SO₂).

(b) The maximum calibration drift performance specification for the SO₂ CEMS is 2.5% of the span value (40 CFR 60, Appendix B, P.S.2,13.1). The span value is 1000 ppm as specified at 40 CFR 60.84(a).

Table 2
Calibration Drift Determination - "C" Sulfuric Acid Plant
January 23 - January 29, 2005 - O2 CEMS

| Date | Reference Value | CEMS Response | Calibration Drift |
|-----------|-----------------|---------------|-------------------|
| | % O2 (a) | % O2 | % O2 (b) |
| 23-Jan-05 | 15.1 | 15.0 | 0.1 |
| 24-Jan-05 | 15.1 | 15.1 | 0.0 |
| 25-Jan-05 | 15.1 | 15.1 | 0.0 |
| 26-Jan-05 | 15.1 | 15.1 | 0.0 |
| 27-Jan-05 | 15.1 | 15.1 | 0.0 |
| 28-Jan-05 | 15.1 | 15.3 | 0.2 |
| 29-Jan-05 | 15.1 | 15.2 | 0.1 |

- (a) The zero point is checked daily against the certified O2 reference gas (0% O2). The CEMS reading is also checked daily against clean instrument air at 20.9% O2.
- (b) The maximum calibration drift performance specification for the O2 CEMS is 0.5% O2 (40CFR60, Appendix B, P.S.3,13.1).
