Tallahassee, Florida 32201

Attention: Mr. Clair Fancy

Re: Application for Air Quality Permits, McKay Bay Refuse-to-Energy Project

Dear Mr. Fancy:

The attached document is the City of Tampa's application for the air quality permits required for the McKay Bay Refuse-to-Energy Project. The City is participating as lead agency in the development of a program to convert refuse into energy in the form of electricity. The McKay Bay Refuse-to-Energy Project is the culmination of three years of planning efforts by the local governments of Hillsborough County. We feel the project is a progressive approach, consistent with the policies of the Federal and State governments and the desires of the local residents.

The project will consist of two facilities; the rehabilitation of the closed Tampa Municipal Incinerator and the construction of a new refuse to energy plant adjacent to the incinerator. Although we are submitting the applications for these facilities simultaneously, we request that separate permits be issued. Additionally, we request that you review our application for compliance with Federal and Florida P.S.D. rules, Florida State Air rules, and New Source rules and regulations.

We wish to thank you for your efforts to date and look forward to continued cooperation on this issue. If you require additional information or have questions concerning our submittal, please contact me or my staff at 813-223-8090.

Very truly yours,

Richard D. Garrity, PhD
Urban Environmental Coordinator

RDG/kpc
cc: Dale H. Twachtmann

PERTINENT APPLICANT INFORMATION

Applicant's Official Name: City of Tampa

Address: 306 E. Jackson
Tampa, Florida 33602

Name and Title of Business Head: Robert Martinez, Mayor
City of Tampa

Name and Title and Address of Representative responsible for obtaining certification: Dale H. Twachtmann, Administrator
Water Resource and Public Works
8th Floor N. City Hall Plaza
Tampa, Florida 33602

Site Location: County - Hillsborough
Nearest Incorporated City - Tampa
Latitude - 27° 56' 51" N
Longitude - 82° 25' 14" W

Name Plate Generating Capacity of Proposed Facilities: 45 Megawatts

REMARKS: The McKay Bay Refuse-To-Energy Project is being constructed for the disposal of solid waste and the subsequent recovery of energy and materials. The economic impact of delays to the project are substantial. For example, using a 12 percent escalation rate, the increase in construction cost for each day the implementation process is delayed beyond the recommended schedule is \$58,350. The magnitude of this increase only emphasizes the importance of timely approval of the permit application.

Professional Engineer Submitting Application

Omaha, Nebraska 68114

EXECUTIVE ORDER

NO. 81-4

WHEREAS, the participating governments of Hillsborough County have taken official action to modify the Amendment and Restatement of Interlocal Agreement for Administration, Construction and Operation of a Resource Recovery Program, effective June 8, 1981; and

WHEREAS, the City of Tampa has been designated as the lead agency responsible for proceeding with the implementation of the program; and

WHEREAS, certain employees, funds, and other assets of the program are transferred to the City of Tampa effective this date;

NOW, THEREFORE,

By virtue of the authority vested in me as the Mayor of the City of Tampa by the Revised Charter of the City of Tampa of 1975, and the Laws of the State of Florida, I do hereby prescribe and promulgate by Executive Order an addition to the organization of the administrative structure of the City of Tampa as follows:

PART I -- ESTABLISHMENT OF THE MCKAY BAY REFUSE-TO-ENERGY PROJECT.

Section 1.01 The McKay Bay Refuse-to-Energy Project is hereby established.

Section 1.02 The project is the direct administrative responsibility of the Administrator of Water Resources & Public Works, who will set forth additional administrative structure as necessary.

Section 1.03 All departments of the City that have coordination responsibilities with this project for the care of funds, personnel, and other assets or for assisting in its other efforts are hereby notified of the urgency of the project and the need for decisive and cooperative action to expedite its mission.

PART II. EFFECTIVE DATE.

Section 1.01 This order shall take effect on June 8, 1981.

Bob Matherne
Mayor

DATE:

June 8, 1981

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

Background

In Hillsborough County, with the City of Tampa as the lead agency under a negotiated interlocal agreement, there has been an increased interest in solid waste disposal and the concept of energy recovery from solid wastes. This has been stimulated by an increased awareness of the environmental and siting problems associated with past disposal methods, and by the increased cost of energy. Each of the cities in Hillsborough County maintains a solid waste collection system within its respective boundaries, while the County is responsible for the collection system in the unincorporated areas. Residential waste is usually collected twice a week, with more frequent collections for commercial waste.

The solid waste generated in Hillsborough County is currently disposed of in the Hillsborough Heights Landfill. In previous years other landfills and the Tampa incinerator were used for solid waste disposal but these are now closed. The Ruskin Landfill operated until August 1, 1978 when the waste they were handling was diverted to the Taylor Road Landfill. The Plant City Landfill operated until October 1, 1979 when this waste was diverted to the Taylor Road Landfill. The City of Tampa operated its incinerator until December 31, 1979 when it was closed because of air and water pollution problems. When this facility ceased operation, those wastes were also diverted to the Taylor Road Landfill. Hillsborough Heights replaced the adjacent Taylor Road Landfill in February 1980. In April 1981 the Northwest Landfill was closed and its wastes were diverted to Hillsborough Heights. Figure 1 shows the locations of solid waste facilities in Hillsborough County.

Because of landfill capacity limitations and environmentally imposed deadlines concerning the only operating waste disposal site, the City, as lead agency, has initiated actions to site, design and permit a new landfill by March 1982. The new landfill will be used for both a residue disposal site for the proposed resource recovery system and as an emergency back-up system for disposal of raw municipal solid waste in the event of a system failure.

EXISTING SOLID WASTE FACILITIES

HILLSBOROUGH COUNTY

FIGURE 1

Resource Recovery Plan

In September 1980, the Board of County Commissioners of Hillsborough County approved a resource recovery plan to minimize solid waste management costs by converting the municipal solid waste to energy and secondary materials. The revenues from the energy and secondary materials would help decrease the total disposal cost.

As presently envisioned, the resource recovery plan has three parts: 1) the rehabilitation and enlargement of the existing Tampa Incinerator; 2) the construction of a new resource recovery facility; and 3) the siting of a new landfill for residue disposal.

Facility 1

Facility 1 is located on a 14 acre site adjacent to McKay Bay, south of U.S. Route 60. Figure 2 is the site plan of the incinerator as it presently exists.

The incinerator system consists of three mass burn combustion trains without energy recovery, based upon the Volund technology. Each unit is rated at 250 TPD. Design engineers have inspected the incinerator, and it can be rehabilitated and converted into a resource recovery system capable of generating electricity for sale to TECO. The rehabilitation of the incinerator will include the addition of waste heat boilers, electrostatic precipitators for particulate control, and turbine generators, with all support equipments and instrumentation. The inplace combustion system will also be modified to bring the facility into "like new" operating condition for long-term operation, and design features of modern refuse to energy systems will be incorporated.

Figure 3 shows a potential equipment configuration, with a boiler and electrostatic precipitator added to the existing equipment.

Three 250 tpd combustion trains are currently in place at the Incinerator, with space for a fourth unit. The fourth unit will be added, thus increasing the design capacity of the facility to 1000 TPD. By considering the online equipment availability, approximately 300,000 tons per year of solid waste can be disposed of by the facility.

FIGURE 2

4

SITE PLAN OF TAMPA INCINERATOR

The steam generated by the four boilers will be used to produce electricity in a 21 MW condensing turbine generator. All electrical generation support systems will be provided to sustain operation on an annual operating schedule consistent with parameters used in the electrical utility industry.

Air emissions generated by the combustion process will be controlled within accepted standards by a multi-cyclone mechanical separator and an electrostatic precipitator (ESP) for each incinerator/boiler train. The treated flue gas will be vented through individual flues within a common chimney.

Ash produced by the combustion process will be handled by a wet system. The wet ash will be dewatered and loaded into trucks for subsequent disposal in the City's designated residue disposal site. On a dry basis, the ash quantity requiring landfilling is estimated to be a 15 percent by weight and 5 percent by volume of the input solid waste combusted.

Facility 2

In addition to the Incinerator conversion, the resource recovery plan calls for the construction of a new facility to accommodate a significant portion, i.e. 50-60% of the solid waste generated. The site of this facility will be located adjacent to the Facility 1 site on McKay Bay. The capacity of the facility is proposed to be 1000 TPD.

The facility will be of the mass burn type, using either the rotary kiln or waterwall technology. The ultimate energy output from the system finally selected will be electrical energy for sale to TECO.

Mass burn technology, a variation of which was used in Facility 1, is based upon the combustion of unprocessed solid waste in a specifically designed furnace system that facilitates complete burnout and generates heat for subsequent energy recovery. The heat produced will pass through waste heat boilers to produce high pressure steam which will be converted into electricity by inplant turbine generators.

FIGURE 3

The important characteristic of the mass burn systems is that no processing or separation of the refuse components is required other than to remove oversize bulky items from the mixed waste before refuse is fed to the furnaces for combustion. Noncombustibles in the refuse are handled as furnace ash residue. Recyclable materials such as ferrous metals and aluminum can be recovered from the ash residue and sold. The remaining non-recyclable residue fraction normally requires landfilling. The air pollution control system used most often by the various system vendors is a multicyclone followed by individual multifield electrostatic precipitators. Figure 4 is a proposed site plan showing both facilities.

Emissions

The emissions that will be used in the modeling of the facilities are shown in Table 1.

The data for the Tampa Incinerator Conversion (Facility 1) was obtained from Waste Management Inc. (WMI) test data on similar units. The Facility 2 data is conservative data assimilated from recent proposals for a similar facility.

Table 1
Expected Emissions

	Facility 1 gm/s	Facility 1 TPY	Facility 2 gm/s	Facility 2 TPY	TOTAL TPY
Particulate (Controlled)	4.6	160	3.2	109	269
Sulfur Dioxide	20.8	722	12.1	420	1142
Nitrogen Oxides	26	903	9.5	330	1233
Carbon Monoxide	1.68	58	5.8	200	258
Hydrocarbons	.92	32	.92	32	64
Lead	.47	16.3	.47	16.3	32.6
Mercury (vaporous)	.05	1.8	.05	1.8	3.6
Mercury (particulate)	2.3×10^{-3}	.08	2.3×10^{-3}	.08	.16
Beryllium	4.0×10^{-5}	1.4×10^{-3}	4.0×10^{-5}	1.4×10^{-3}	2.8×10^{-3}
Fluoride	.53	18.4	.53	18.4	32.6
Hydrogen Chloride	23.7	823	23.7	823	1646

FIGURE 4

MCKAY BAY
REFUSE - TO - ENERGY PROJECT

The National Emission Standards for Hazardous Air Pollutants (NESHAP) rules for Beryllium require that no more than 10 grams/day be emitted. The conservative data used in these estimates indicate an emission rate of less than seven (7) grams of Beryllium per day.

The NESHAP rules for Mercury are applicable to those sources that process mercury ore, use mercury chlor-alkali cells, or dry and/or incinerate wastewater treatment plant sludges. There are currently no plans for either Facility 1 nor Facility 2 to process or burn any wastewater treatment plant sludges.

Monitoring Requirements

The Prevention of Significant Deterioration (PSD) regulations dated August 7, 1980 state that monitoring data is to be collected for each pollutant the source will emit in significant amounts. There is an exemption allowed, at the Administrator's discretion, if the modeled impacts are below certain amounts. The impact of most pollutants for which the project will be significant are below this de minimus value.

Both facilities will be significant sources for particulate, sulfur dioxide, nitrogen oxide, carbon monoxide, hydrocarbons, lead, beryllium, mercury, and hydrogen flouride. When the impacts of both facilities are included, the pollutants that exceeds the de minimus value are sulfur dioxide, lead, and hydrogen flouride. Monitoring data has been acquired from the Hillsborough County Environmental Protection Commission (HCEPC) monitors shown in Figure 5. This monitoring data has been used to fulfill the monitoring requirements of 40 CFR 52.21 (m)(iv). The hydrogen flouride monitoring data has not been provided in accordance with DER negotiations and the Preamble to the August 7, 1980 PSD rules.

The sulfur dioxide monitoring data has been supplied from two existing monitors operated by the HCEPC. They are pulsed florescence monitors located on Hookers Point near the locations of the maximum annual impact. The lead data was obtained from the four lead monitors in the downtown area.

FIGURE 5

To determine impacts, the CRSTER model of the entire Project was used with 1970-1974 meteorological data. If each facility were modeled separately the results would be smaller than those predicted by CRSTER. This scenario overlays both maximums instead of separating them by some distance.

The input emission rate was 1.0 gm/sec/250 TPD unit. This rate was used as a base amount to simplify converting the data to represent each pollutant. Table 2 shows the results of the modeling and the values presented in 40 CFR 52.21 (i)(8). The presented data demonstrates that the emissions from both phases of the City of Tampa Resource Recovery project will cause a small impact on the air quality in the area.

Table 2
Modeling Results for Both Facilities

	Deminimus Value, ug/m ³ / Time Period	Highest Modeled Amount ug/m ³ /Time Period
Particulate	10/24 hr.	5.8/24 hr.
Sulfur Dioxide	13/24 hr.	24.8/24 hr.
Nitrogen Dioxide	14/annual	2.3/annual
Carbon Monoxide	575/8 hr.	11/(3 hr. avg.)
Lead	0.1/24 hr.	0.7/24 hr.
Mercury	0.25/24 hr.	0.08/24 hr.
Beryllium	5x10 ⁻⁴ /24 hr.	6x10 ⁻⁵ /24 hr.
Flouride	.25/24 hr.	0.7/24 hr.

Offsets

The sites chosen for the Resource Recovery Project are within nonattainment areas for particulate and ozone. This will necessitate the acquisition of offsets for particulates and hydrocarbons from other sources in the area.

The majority of the offsets for the particulate emission will come from the emission from the old incinerator. We are aware that these offsets will not be available until the SIP is approved by EPA. In the interim we propose to use the resource recovery exemption. To show a good faith effort, each major source of particulate emissions in the non attainment area has been contacted to ascertain the availability of offsets.

To offset the hydrocarbon emissions we propose to use the existing New Source Allowance. Since the combined facilities will only emit 64 TPY, the available New Source allowance will provide sufficient offsets.

Air Pollution Control

The air emissions control review will vary for each substance emitted from the stack with the Lowest Achievable Emission Rate (LAER) and Best Available Control Technology (BACT) regulations providing the scope.

LAER

Emissions of particulates and volatile organic compounds (VOC) must comply with LAER regulations. For this project we support a LAER for particulates of 0.03 gr/dscf at 12% CO₂, 50% excess air. Based upon a review of the operating experience with dry and wet scrubbers, fabric filters, and electrostatic precipitators at solid waste incinerators and resource recovery facilities, an electrostatic precipitator has been selected to achieve LAER for particulates.

The level of hydrocarbon emissions is influenced by the operation of the solid waste combustion unit and the uniformity of the feed. LAER compliance will be achieved by maintaining the maximum possible homogeneity in the solid waste feed, feeding the solid waste at uniform rates, maintaining high combustion temperatures and properly controlling air flow.

BACT

BACT analysis for the emission of nitrogen oxides, sulfur dioxide, carbon monoxide, lead, beryllium, mercury and hydrogen flouride has been prepared pursuant to applicable Federal and State regulations, notably Title 40, Part 52 of the Federal regulations, and the guidelines presented in the "Prevention of Significant Deterioration" workshop manual prepared by the U.S. Environmental Protection Agency. The BACT analysis has determined:

- The pollutants to which BACT applies, (listed previously)
- The emission source to which BACT applies, (i.e., the stack emissions).

The potentially sensitive air quality concerns which the Tampa project will affect are to be determined.

The control strategies selected for BACT analysis are as follows:

Recommended

<u>Pollutant</u>	<u>Strategy</u>
sulfur dioxide	use of low sulfur solid waste as fuel
nitrogen oxides	combustion unit design and operation
carbon monoxide	combustion unit design and operation
lead	ESP, as design for particulate removal
beryllium	ESP, as design for particulate removal
mercury	no control
flouride	no control

Alternative

<u>Pollutant</u>	<u>Strategy</u>
sulfur dioxide	dry or wet scrubbers
nitrogen oxides	none proven
carbon monoxide	none
lead	ESP
beryllium	ESP
mercury	dry or wet scrubbers
flouride	dry or wet scrubbers

Systems were examined for the control of some air emissions from the Project subject to BACT (i.e., sulfur dioxide and nitrogen oxides). However, lack of operating experience with these systems installed at resource recovery facilities suggests their use by the Project is not appropriate.

The economic and energy impact of the recommended alternative for the control of nitrogen oxides, sulfur dioxide, carbon monoxide, lead, beryllium, mercury, and hyrdogen flouride will be considered as zero because the alternatives will be implemented for other dominant purposes or have no identifiable cost or energy usage. The environmental impacts were developed concurrently with the modeling of the air quality impacts. In summary, the recommended air emissions control technologies for compliance with LAER and BACT regulations have been identified.

Other Impacts

The Hillsborough County City-County Planning Commission publication entitled, "Population and Housing Estimates," April 1, 1970-April 1, 1980 projects the population of Hillsborough County to increase from 630,698 to 757,300 persons from 1980 to 1985. This increase of 126,602 people represents a 20% increase in 5 years. The future projections continue to the year 2000 with an estimated increase of 63% within 20 years. For the City of Tampa and the Hillsborough County project of the rehabilitation the present Tampa Bay incinerator and the construction of a new facility, the workforce is expected to average between 150 and 300 persons throughout the contruction phase. With the present construction in the surrounding area it is feasible to state that the majority of construction workforce will be available locally. There may be some relocation to move closer to the project site but this action would be considered negligible in impact analysis. The figure of 150 persons represents less than .03% of the total population. For the operation of the facilities a projected employment of 65 persons per facility is expected.

The most significant air emission anticipated during construction is fugitive dust generated by numerous vehicles for the transportation of the workforce. Additionally anywhere from 5-12 pieces of construction equipment will be used in excavating, scraping, filling and compacting. Fugitive dust can be reduced by the frequent spraying of water on the site and roadway.

Noise generation is another characteristic of construction activity. This nuisance will be generally limited to normal working hours thus allowing a reduction of noise during the evening hours.

For the operational phase atmospheric emission will be controlled by the use of Electrostatic Precipitators (ESP). To date ESP's are the only proven technology for

the removal of particulate matter from resource recovery facilities. The efficiencies of ESP's have been proven to be as high as 99.9%.

Fugitive dust emissions from the operational phase will be primarily caused by the frequent delivery of solid waste to the facility. With proper surface treatment these emissions are minimized. Dust and odors in the refuse handling area will be controlled by the total enclosure of the tipping area. This area will also be placed under negative pressure with the air then being used in the combustion phase.

The primary source of noise during the operational phase is the movement of the solid waste delivery vehicles. Again the delivery hours for the facilities will be restricted to normal working hours, thus reducing the nuisance potential.

The traffic patterns will be affected with the delivery of solid waste by vehicles. Also the arrival and departure of the shift workforce will have some impact. However, the majority of the impact will be during the normal rush hours of daylight.

Explosions or fires within the pit areas are minimized by the thorough training of the crane operators who manage this area. Any smoldering material can be loaded immediately into a combustion unit and firehoses and sprinklers will also be available. If explosive material were accidentally fed into a combustion unit, any resulting explosion would be dissipated within the large volume of the boiler.

Vermin and rodent control of the pit area is accomplished by the enclosure of the pit. The refuse is managed within the pit by the crane operator to minimizing, any concentrations of food supplies. The refuse in the pit will be stored no more than forty eight hours before being combusted. This will eliminate vermin and rodent survivability.

CHAPTER 1

PURPOSE AND SCOPE

PURPOSE AND SCOPE

This document is to apply for separate Environmental Protection Agency Air Quality Permits assuring Prevention of Significant Deterioration for the two phases of the McKay Bay Refuse-to-Energy Project. We are also requesting concurrent review for a Florida Permit to Construct an Air Pollution Source.

In Hillsborough County, there has been an increased interest in solid waste disposal and the concept of resource recovery from solid wastes. This interest has been stimulated by increased awareness of the environmental and siting problems associated with past disposal methods and by the shortages and increased prices of energy and recyclable materials. The City of Tampa in cooperation with the county and the cities of Temple Terrace and Plant City, in keeping with State and Federal Policy, have selected a refuse-to-energy implementation plan as a long-term solid waste control strategy. This plan is divided into two phases. Phase I consists of rehabilitating and upgrading of the present Tampa incinerator (Facility 1). Phase II will be the construction of a second Refuse-To-Energy facility (Facility 2) located adjacent to the present incinerator.

In Hillsborough County, the only permitted landfill is under an enforcement order to close by October, 1984. A siting effort is underway but the permitting of a landfill has not yet begun. With a refuse to energy facility a landfill will still be needed however residue from the facilities will require only 10% of the space required to landfill the same quantity of raw solid waste. This landfill will handle the unprocessable wastes, the residual ash and raw refuse the project is unable to process. The residue going to the landfill will represent 15% of the mass but only 5% of the volume of the processed waste.

Facility II has not been designed. Conceptual design features are presented here. The projected emissions were developed from proposals for a recent facility and represent best engineering judgement and it is requested that you

accept them as such. The equipment discussed has been accepted as "proven technology" in other refuse to energy projects. This term can be defined as that technology which has been historically proven reliable by operating successfully for several years.

The field of resource recovery is such that a technology is not considered proven until a full size unit has been built and operated successfully. Deviations from accepted proven technology would increase the risk perceived by the financial community, thereby substantially increasing the cost of bonding the facility or ultimately undermining the sale of the bonds.

REHABILITATION OF THE TAMPA INCINERATOR (Facility I)

The closed Tampa Incinerator is located on a 14 acre site adjacent to McKay Bay south of Route U. S. 60. Figure 1-1 is the site plan of the McKay Bay Project. The existing incineration system presently consists of three Volund Technology mass burn combustion trains without energy recovery. Each is rated at 250 TPD. Design engineers have inspected the incinerator and have determined that it can be rehabilitated and converted into a state-of-the-art resource recovery system capable of generating electricity for sale to Tampa Electric Company (TECO). Figure 1-2 depicts a cross sectional view of the existing equipment. To renovate the incinerator waste heat boilers, electrostatic precipitators for particulate control and a turbine generator, with all support equipment and instrumentation, will have to be added. In addition, the in-place combustion system will have to be modified to bring the facility into a guaranteed operating condition for long-term operation and incorporation of modern design features.

Figure 1-3 shows the probable equipment configuration with a boiler and electrostatic precipitator added to the existing equipment. Three combustion trains were initially constructed with adequate space left in the building to add a fourth unit at a later date. Adding the fourth unit would increase the design capacity of the facility to at least 1000 TPD and provide the capability to dispose of a maximum of approximately 300,000 tons per year of solid waste.

CROSS-SECTIONAL VIEW OF THE TAMPA INCINERATOR

FIGURE
I - 3

CROSS-SECTIONAL VIEW OF THE TAMPA INCINERATOR
WITH RESOURCE RECOVERY EQUIPMENT ADDED

The steam generated by the four boilers will be used to produce electricity in a condensing turbine generator. (See Figure 1-4) All generation support systems will be provided to sustain operation on an annual operating schedule consistent with parameters used in the electrical utility industry.

Non-attainment air emissions produced by the combustion process will be controlled to lowest achievable emission rate (LAER) of 0.03 gr/dscf at 50% excess air by an electrostatic precipitator (ESP) for each incinerator/boiler train. Control of other pollutants will be discussed in Chapter 6. The treated flue gas will be vented to the atmosphere through individual flues within a common 46 meter chimney which represents the good engineering practice (GEP) stack height.

Ash produced by the combustion process will be handled by a wet system. The wet ash will be dewatered and loaded into trucks for subsequent disposal in the designated permitted landfill. On a dry basis, the ash quantity requiring landfilling is estimated to be about 15 percent by weight of the input solid waste combusted.

Other modifications will include an enclosed tipping area which will be placed under negative pressure to control dust and odor. The recovery of secondary materials is also a possibility.

NEW RESOURCE RECOVERY FACILITY (Facility 2)

The new Resource Recovery Facility will be located adjacent to Facility I. The incineration system will be two mass burn units capable of processing a total of 1000 tons per day of solid waste. The Facility 2 will include the recovery of secondary materials and the production of electricity for sale to the Tampa Electric Company. Two alternative site plans are shown in Figures 1-5 and 1-6.

Facility 2 will be designed to provide a minimum annual plant capacity of 300,000 tons per year and a minimum weekly capacity of 7,000 tons per week.

FIGURE I - 4

**Schematic Diagram
Electrical Generation**

MCKAY BAY
REFUSE - TO - ENERGY PROJECT

FIGURE I-6

MCKAY BAY
REFUSE - TO - ENERGY PROJECT

Air pollution control systems will reflect the Lowest Achievable Emission Rate (LAER) for particulate. The particulate emissions shall be less than 0.03 grains/dscf corrected to 12% carbon dioxide (equivalent to 0.03 grains/dscf at 50% excess air). Facility 2 will be designed to control odors resulting from the handling, storage and processing of solid waste so as not to create a health hazard or public nuisance. The tipping floor will be totally enclosed and provide as a minimum the space for the equipment of 12 compacted 75-cubic yard transfer tractor/trailer vehicles to dump simultaneously. The tipping floor will be under negative pressure at all times when the plant is in operation. During periods when the plant is shut down, appropriate measures, including removing refuse from the pit for disposal at the landfill will be taken to minimize odors and health hazards.

The facility will be designed to the emission limitation set forth in this document. Figure 1-7 shows a cross section and the vital components of a new generation, waterwall, and mass burn incinerator.

CHAPTER 2

APPLICATION FORMS

STATE OF FLORIDA
DEPARTMENT OF ENVIRONMENTAL REGULATION
APPLICATION TO OPERATE/CONSTRUCT
AIR POLLUTION SOURCES

SOURCE TYPE: Resource Recovery Incinerator New¹ Existing¹

APPLICATION TYPE: Construction Operation Modification

COMPANY NAME: City of Tampa COUNTY: Hillsborough

Identify the specific emission point source(s) addressed in this application (i.e. Lime Kiln No. 4 with Venturi Scrubber; Peaking Unit No. 2, Gas Fired) Tampa Incinerator Rehabilitation

SOURCE LOCATION: Street 14 Acre site adjacent to McKay Bay City Tampa

UTM: East 360000 North 3091900

Latitude 27 ° 56' 51" N Longitude 82 ° 25' 14" W

APPLICANT NAME AND TITLE: Dale H. Twachtmann, Administrator, Water Resources & Public Work

APPLICANT ADDRESS: 8th Floor - City Hall Plaza, Tampa, Florida 33602

SECTION I: STATEMENTS BY APPLICANT AND ENGINEER

A. APPLICANT

I am the undersigned owner or authorized representative* of McKay Bay Refuse-To-Energy Project

I certify that the statements made in this application for a construction permit are true, correct and complete to the best of my knowledge and belief. Further, I agree to maintain and operate the pollution control source and pollution control facilities in such a manner as to comply with the provision of Chapter 403, Florida Statutes, and all the rules and regulations of the department and revisions thereof. I also understand that a permit, if granted by the department, will be non-transferable and I will promptly notify the department upon sale or legal transfer of the permitted establishment.

*Attach letter of authorization

Signed:

Dale H. Twachtmann, WR&P
Name and Title (Please Type)

Date: 23 July 81 Telephone No. 813-223-8771

B. PROFESSIONAL ENGINEER REGISTERED IN FLORIDA (where required by Chapter 471, F.S.)

This is to certify that the engineering features of this pollution control project have been designed/examined by me and found to be in conformity with modern engineering principles applicable to the treatment and disposal of pollutants characterized in the permit application. There is reasonable assurance, in my professional judgment, that the pollution control facilities, when properly maintained and operated, will discharge an effluent that complies with all applicable statutes of the State of Florida and the rules and regulations of the department. It is also agreed that the undersigned will furnish, if authorized by the owner, the applicant a set of instructions for the proper maintenance and operation of the pollution control facilities and, if applicable, pollution sources.

Signed:

R. Lee Torrens

Name (Please Type)

Henningson, Durham & Richardson

Company Name (Please Type)

8404 Indian Hills Drive, Omaha, NE 68114

Mailing Address (Please Type)

Date: 7/23/81 Telephone No. 402-399-1000

(Affix Seal)
A.O. 2/27/84
STATE OF FLORIDA
Division of
Environmental Regulation
Florida Registration No. 21274

¹See Section 17-2.02(15) and (22), Florida Administrative Code, (F.A.C.)

SECTION II: GENERAL PROJECT INFORMATION

- A. Describe the nature and extent of the project. Refer to pollution control equipment, and expected improvements in source performance as a result of installation. State whether the project will result in full compliance. Attach additional sheet if necessary.

Renovate existing incinerator, add heat recover for steam production for electricity generation, addition of electrostatic precipitators to control particulate emissions. The facility will operate in full compliance of all existing regulations.

- B. Schedule of project covered in this application (Construction Permit Application Only)

Start of Construction Early 82 Completion of Construction Early 84

- C. Costs of pollution control system(s): (Note: Show breakdown of estimated costs only for individual components/units of the project serving pollution control purposes. Information on actual costs shall be furnished with the application for operation permit.)

Pollution Control \$4,000,000-\$7,000,000

Due to LAER requirements cost is not a factor in the technology choice.

See Chapter 5

- D. Indicate any previous DER permits, orders and notices associated with the emission point, including permit issuance and expiration dates.

Tampa Incinerator was shut down in Dec 1979 under consent decree of FPA.

- E. Is this application associated with or part of a Development of Regional Impact (DRI) pursuant to Chapter 380, Florida Statutes, and Chapter 22F-2, Florida Administrative Code? Yes No

- F. Normal equipment operating time: hrs/day 24; days/wk 7; wks/yr 52; if power plant, hrs/yr 8760; if seasonal, describe: with approximately 20% down time for maintenance

- G. If this is a new source or major modification, answer the following questions. (Yes or No)

1. Is this source in a non-attainment area for a particular pollutant? yes - Chapter 3

a. If yes, has "offset" been applied? yes - Chapter 6

b. If yes, has "Lowest Achievable Emission Rate" been applied? yes - Chapter 5

c. If yes, list non-attainment pollutants.

total suspended particulate and VOC

2. Does best available control technology (BACT) apply to this source? If yes, see Section VI. yes - Chapter 4

3. Does the State "Prevention of Significant Deterioration" (PSD) requirements apply to this source? If yes, see Sections VI and VII. yes - Chapter 3

4. Do "Standards of Performance for New Stationary Sources" (NSPS) apply to this source? yes

5. Do "National Emission Standards for Hazardous Air Pollutants" (NESHAP) apply to this source? yes - Chapter 3

Attach all supportive information related to any answer of "Yes". Attach any justification for any answer of "No" that might be considered questionable.

SECTION III: AIR POLLUTION SOURCES & CONTROL DEVICES (Other than Incinerators)

A. Raw Materials and Chemicals Used in your Process, if applicable:

Description	Contaminants		Utilization Rate - lbs/hr	Relate to Flow Diagram
	Type	% Wt		

B. Process Rate, if applicable: (See Section V, Item 1)

1. Total Process Input Rate (lbs/hr): _____
2. Product Weight (lbs/hr): _____

C. Airborne Contaminants Emitted:

Name of Contaminant	Emission ¹		Allowed Emission ² Rate per Ch. 17-2, F.A.C.	Allowable ³ Emission lbs/hr	Potential Emission ⁴ lbs/hr T/yr	Relate to Flow Diagram
	Maximum lbs/hr	Actual T/yr				

D. Control Devices: (See Section V, Item 4)

Name and Type (Model & Serial No.)	Contaminant	Efficiency	Range of Particles ⁵ Size Collected (in microns)	Basis for Efficiency (Sec. V, It ⁵)

¹See Section V, Item 2.

²Reference applicable emission standards and units (e.g., Section 17-2.05(6) Table II, E. (1), F.A.C. – 0.1 pounds per million BTU heat input)

³Calculated from operating rate and applicable standard

⁴Emission, if source operated without control (See Section V, Item 3)

⁵If Applicable

E. Fuels

Type (Be Specific)	Consumption*		Maximum Heat Input (MMBTU/hr)
	avg/hr	max./hr	

*Units Natural Gas, MMCF/hr; Fuel Oils, barrels/hr; Coal, lbs/hr

Fuel Analysis:

Percent Sulfur: _____ Percent Ash: _____

Density: _____ lbs/gal Typical Percent Nitrogen: _____

Heat Capacity: _____ BTU/lb _____ BTU/gal

Other Fuel Contaminants (which may cause air pollution): _____

F. If applicable, indicate the percent of fuel used for space heating. Annual Average _____ Maximum _____

G. Indicate liquid or solid wastes generated and method of disposal.

H. Emission Stack Geometry and Flow Characteristics (Provide data for each stack):

Stack Height: _____ ft. Stack Diameter: _____ ft.

Gas Flow Rate: _____ ACFM Gas Exit Temperature: _____ °F.

Water Vapor Content: _____ % Velocity: _____ FPS

SECTION IV: INCINERATOR INFORMATION

Type of Waste	Type O (Plastics)	Type I (Rubbish)	Type II (Refuse)	Type III (Garbage)	Type IV (Pathological)	Type V (Liq & Gas By-prod.)	Type VI (Solid By-prod.)
Lbs/hr Incinerated	5.7% .473x10 ⁴	29.5% 2.45x10 ⁴	38.9% 3.23x10 ⁴	9.6% .797x10 ⁴	None	None	16.3% 1.35x10 ⁴

Description of Waste Municipal refuse collected within City of Tampa.

Total Weight Incinerated (lbs/hr) 8.3x10⁴ Design Capacity (lbs/hr) 8.3x10⁴

Approximate Number of Hours of Operation per day 24 days/week 7

Manufacturer Unknown - to be determined.

Date Constructed _____ Model No. _____

	Volume (ft) ³	Heat Release (BTU/hr)	Fuel		Temperature (°F)
			Type	BTU/hr	
Primary Chamber	N/A	3.56×10^8	solid waste	3.75×10^8	1600 - 1800° F
Secondary Chamber					

Stack Height: 150 ft. Stack Diameter 4 flues 4.43 ft. Stack Temp. 450° F
 Gas Flow Rate: 65,000 ACFM .03 gr/ DSCFM* Velocity 70 FPS

*If 50 or more tons per day design capacity, submit the emissions rate in grains per standard cubic foot dry gas corrected to 50% excess air.

Type of pollution control device: Cyclone Wet Scrubber Afterburner Other (specify) ESP

Brief description of operating characteristics of control devices: Electrostatic Precipitators work by electrostatic forces caused by charging the particles and collecting them on oppositely charged walls

Ultimate disposal of any effluent other than that emitted from the stack (scrubber water, ash, etc.):

Ash to permitted landfill

Cooling tower & boiler blowdown to sanitary sewer

SECTION V: SUPPLEMENTAL REQUIREMENTS

Please provide the following supplements where required for this application.

1. Total process input rate and product weight – show derivation.
2. To a construction application, attach basis of emission estimate (e.g., design calculations, design drawings, pertinent manufacturer's test data, etc.) and attach proposed methods (e.g., FR Part 60 Methods 1, 2, 3, 4, 5) to show proof of compliance with applicable standards. To an operation application, attach test results or methods used to show proof of compliance. Information provided when applying for an operation permit from a construction permit shall be indicative of the time at which the test was made.
3. Attach basis of potential discharge (e.g., emission factor, that is, AP42 test).
4. With construction permit application, include design details for all air pollution control systems (e.g., for baghouse include cloth to air ratio; for scrubber include cross-section sketch, etc.).
5. With construction permit application, attach derivation of control device(s) efficiency. Include test or design data. Items 2, 3, and 5 should be consistent: actual emissions = potential (1-efficiency).
6. An 8½" x 11" flow diagram which will, without revealing trade secrets, identify the individual operations and/or processes. Indicate where raw materials enter, where solid and liquid waste exit, where gaseous emissions and/or airborne particles are evolved and where finished products are obtained.
7. An 8½" x 11" plot plan showing the location of the establishment, and points of airborne emissions, in relation to the surrounding area, residences and other permanent structures and roadways (Example: Copy of relevant portion of USGS topographic map).
8. An 8½" x 11" plot plan of facility showing the location of manufacturing processes and outlets for airborne emissions. Relate all flows to the flow diagram.

9. An application fee of \$20, unless exempted by Section 17-4.05(3), F.A.C. The check should be made payable to the Department of Environmental Regulation.
10. With an application for operation permit, attach a Certificate of Completion of Construction indicating that the source was constructed as shown in the construction permit.

SECTION VI: BEST AVAILABLE CONTROL TECHNOLOGY *

- A. Are standards of performance for new stationary sources pursuant to 40 C.F.R. Part 60 applicable to the source?
 Yes No

Contaminant	Rate or Concentration
Particulate	0.08 gr/dscf at 12% CO ₂

- B. Has EPA declared the best available control technology for this class of sources (If yes, attach copy) Yes No

Contaminant	Rate or Concentration

- C. What emission levels do you propose as best available control technology? None

Contaminant	Rate or Concentration
all emission but particulate	at potential to emit rate = without controls
	See Chapters 3 and 4

- D. Describe the existing control and treatment technology (if any).

1. Control Device/System:

2. Operating Principles:

3. Efficiency: *

5. Useful Life:

7. Energy:

9. Emissions:

4. Capital Costs:

6. Operating Costs:

8. Maintenance Cost:

Contaminant	Rate or Concentration

*Explain method of determining D 3 above.

*See Chapter 6

10. Stack Parameters

a. Height: 150	ft.	b. Diameter: 4 x 4.43 ft	ft.
c. Flow Rate: 65,000/unit	ACFM	d. Temperature: 450	°F
e. Velocity: 70	FPS		

E. Describe the control and treatment technology available (As many types as applicable, use additional pages if necessary).

1.

- a. Control Device: wet scrubbers - for SO₂, HF, and gaseous Hg control
- b. Operating Principles: gas intimately contacted with lime slurry. SO₂ and HF react and are removed. Hg condenses and is removed.
- c. Efficiency*: 90% or better; literature
- d. Capital Cost: \$5,280,000
- e. Useful Life: 20 year
- f. Operating Cost: \$643,000/yr
- g. Energy*: 460 Kwh; literature
- h. Maintenance Cost: \$528,500/yr
- i. Availability of construction materials and process chemicals:
Available with appropriate lead time
- j. Applicability to manufacturing processes: Has not been used on U.S. solid waste incineration
- k. Ability to construct with control device, install in available space, and operate within proposed levels:
Could be installed and operated on space available. Has not been done on U.S. solid waste incinerator.

2.

- a. Control Device: Dry scrubber - SO₂, HF, and gaseous Hg control
- b. Operating Principles: lime slurry contacts gas and is dried by flue gas. Particulate control by baghouse on ESP
- c. Efficiency*: 90-99%; literature
- d. Capital Cost: \$7,920,000
- e. Useful Life: projected for 20 yr
- f. Operating Cost: \$ 322,000/yr
- g. Energy**: 482 kwh; literature
- h. Maintenance Costs: \$264,000/yr
- i. Availability of construction materials and process chemicals:
Available with appropriate lead time
- j. Applicability to manufacturing processes: has not been used on any combustion source in U.S.
- k. Ability to construct with control device, install in available space, and operate within proposed levels:
Room to construct. Yet to be proven

*Explain method of determining efficiency.

**Energy to be reported in units of electrical power – KWH design rate.

3.

- a. Control Device: Low sulfur fuel - SO₂ control
- b. Operating Principles: Lower sulfur content in fuel, lower SO₂ emission
- c. Efficiency*: -
- d. Capital Cost: -
- e. Life: -
- f. Operating Cost: -
- g. Energy: 0
- h. Maintenance Cost: -

*Explain method of determining efficiency above.

- i. Availability of construction materials and process chemicals:
 - j. Applicability to manufacturing processes:
 - k. Ability to construct with control device, install in available space and operate within proposed levels:
4.
 - a. Control Device Ammonia injection, wet scrubbers and catalytic reduction for NO_x control
 - b. Operating Principles: X

A laboratory control device - Described in Chapter 4

- c. Efficiency*:
 - d. Capital Cost:
 - e. Life:
 - f. Operating Cost:
 - g. Energy:
 - h. Maintenance Cost:

i. Availability of construction materials and process chemicals:

Not proven on any combustion source, not recommended

Applicability to manufacturing processes:

k. Ability to construct with control device, install in available space, and operate within proposed levels:

F. Describe the control technology selected:

1. Control Device: no additional collection device

- #### **8. Manufacturer:**

9. Other locations where employed on similar processes: This BACT recommendation used on all solid waste-fired boilers in U.S.

- a

- (1) Company:**

- (2) Mailing Address:**

SECTION VII – PREVENTION OF SIGNIFICANT DETERIORATION

A. HCEPC Monitored Data

1. 2 no sites TSP 63/115 (C) SO₂* 63 Wind spd/dir
Period of monitoring 5 / 80 to 5 / 81
month day year month day year

Other data recorded _____

Attach all data or statistical summaries to this application.

2. Instrumentation, Field and Laboratory

- a) Was instrumentation EPA referenced or its equivalent? Yes No
b) Was instrumentation calibrated in accordance with Department procedures? Yes No Unknown

B. Meteorological Data Used for Air Quality Modeling

1. 5 Year(s) of data from 1 / 1 / 70 to 12 / 31 / 74
month day year month day year

2. Surface data obtained from (location) Tampa International Airport

3. Upper air (mixing height) data obtained from (location) Tampa International Airport

4. Stability wind rose (STAR) data obtained from (location) _____

C. Computer Models Used

1. CRSTER Modified? If yes, attach description.
2. _____ Modified? If yes, attach description.
3. _____ Modified? If yes, attach description.
4. _____ Modified? If yes, attach description.

Attach copies of all final model runs showing input data, receptor locations, and principle output tables.

D. Applicants Maximum Allowable Emission Data

Pollutant	Emission Rate
TSP	<u>46</u> grams/sec
SO ₂	<u>20.8</u> grams/sec

E. Emission Data Used in Modeling

in Modeling Section

Attach list of emission sources. Emission data required is source name, description on point source (on NEDS point number), UTM coordinates, stack data, allowable emissions, and normal operating time.

F. Attach all other information supportive to the PSD review. See Chapter 3

*Specify bubbler (B) or continuous (C).

G. Discuss the social and economic impact of the selected technology versus other applicable technologies (i.e., jobs, payroll, production, taxes, energy, etc.). Include assessment of the environmental impact of the sources.

See Other Impact Sections

H. Attach scientific, engineering, and technical material, reports, publications, journals, and other competent relevant information describing the theory and application of the requested best available control technology.

APPLICATION TO OPERATE/CONSTRUCT
AIR POLLUTION SOURCES

SOURCE TYPE: Resource Recovery Incinerator New¹ Existing¹

APPLICATION TYPE: Construction Operation Modification

COMPANY NAME: City of Tampa COUNTY: Hillsborough

Identify the specific emission point source(s) addressed in this application (i.e. Lime Kiln No. 4 with Venturi Scrubber; Peaking Unit No. 2, Gas Fired) New refuse-to-energy facility (Facility 2)

SOURCE LOCATION: Street _____ City _____
UTM: East 360000 North 3091900

Latitude 27 ° 36 ' 51 " N Longitude 82 ° 25 ' 14 " W

APPLICANT NAME AND TITLE: Dale H. Twachtmann, Administrator Water Resources and Public Works
APPLICANT ADDRESS: 8th Floor - City Hall Plaza, Tampa, Florida 33602

SECTION I: STATEMENTS BY APPLICANT AND ENGINEER

A. APPLICANT

I am the undersigned owner or authorized representative* of McKay Bay Refuse-To-Energy Project
I certify that the statements made in this application for a construction

I certify that the statements made in this application for a construction permit are true, correct and complete to the best of my knowledge and belief. Further, I agree to maintain and operate the pollution control source and pollution control facilities in such a manner as to comply with the provision of Chapter 403, Florida Statutes, and all the rules and regulations of the department and revisions thereof. I also understand that a permit, if granted by the department, will be non-transferable and I will promptly notify the department upon sale or legal transfer of the permitted establishment.

*Attach letter of authorization

Signed: Dale H. Twachtmann
Dale H. Twachtmann, Administrator, WR&PW
Name and Title (Please Type)
Date: 23 July 81 Telephone No. 813-223-8771

B. PROFESSIONAL ENGINEER REGISTERED IN FLORIDA (where required by Chapter 471, F.S.)

This is to certify that the engineering features of this pollution control project have been designed/examined by me and found to be in conformity with modern engineering principles applicable to the treatment and disposal of pollutants characterized in the permit application. There is reasonable assurance, in my professional judgment, that the pollution control facilities, when properly maintained and operated, will discharge an effluent that complies with all applicable statutes of the State of Florida and the rules and regulations of the department. It is also agreed that the undersigned will furnish, if authorized by the owner, the applicant a set of instructions for the proper maintenance and operation of the pollution control facilities and, if applicable, pollution sources.

Signed: R. Lee Torrens
Ralph Lee Torrens
Name (Please Type)

Company Name (Please Type)
8404 Indian Hills Drive, Omaha, NE 68114
Mailing Address (Please Type)
Date: 7/23/81 Telephone No. 402-399-1000

Florida Registration No. 21274

¹See Section 17-2.02(15) and (22), Florida Administrative Code, (F.A.C.)

SECTION II: GENERAL PROJECT INFORMATION

- A. Describe the nature and extent of the project. Refer to pollution control equipment, and expected improvements in source performance as a result of installation. State whether the project will result in full compliance. Attach additional sheet if necessary.

Facility 2 of the McKay Bay Refuse-To-Energy Project will be two boilers designed to burn solid waste. This would handle up to 1000 TPD of solid waste. The facility will always perform in full compliance with all applicable regulations.

- B. Schedule of project covered in this application (Construction Permit Application Only)

Start of Construction Mid '82 Completion of Construction Late '85

- C. Costs of pollution control system(s): (Note: Show breakdown of estimated costs only for individual components/units of the project serving pollution control purposes. Information on actual costs shall be furnished with the application for operation permit.)

<u>Particulate Pollution Control</u>	<u>\$4,000,000-\$7,000,000</u>
--------------------------------------	--------------------------------

Due to LAER requirements, cost is not a factor in the technology choice. See Chapter 5.

- D. Indicate any previous DER permits, orders and notices associated with the emission point, including permit issuance and expiration dates.

New Facility.

- E. Is this application associated with or part of a Development of Regional Impact (DRI) pursuant to Chapter 380, Florida Statutes, and Chapter 22F-2, Florida Administrative Code? Yes No

- F. Normal equipment operating time: hrs/day 24; days/wk 7; wks/yr 52; if power plant, hrs/yr _____; if seasonal, describe: With approximately 20% down time for scheduled maintenance.

- G. If this is a new source or major modification, answer the following questions. (Yes or No)

1. Is this source in a non-attainment area for a particular pollutant?

Yes Chapter 3

a. If yes, has "offset" been applied?

Yes Chapter 6

b. If yes, has "Lowest Achievable Emission Rate" been applied?

Yes Chapter 5

c. If yes, list non-attainment pollutants.

Particulate & VOC

2. Does best available control technology (BACT) apply to this source? If yes, see Section VI.

Yes Chapter 4

3. Does the State "Prevention of Significant Deterioration" (PSD) requirements apply to this source? If yes, see Sections VI and VII.

Yes Chapter 3

4. Do "Standards of Performance for New Stationary Sources" (NSPS) apply to this source?

Yes

5. Do "National Emission Standards for Hazardous Air Pollutants" (NESHAP) apply to this source?

Yes Chapter 3

Attach all supportive information related to any answer of "Yes". Attach any justification for any answer of "No" that might be considered questionable.

SECTION III: AIR POLLUTION SOURCES & CONTROL DEVICES (Other than Incinerators)

A. Raw Materials and Chemicals Used in your Process, if applicable:

Description	Contaminants		Utilization Rate - lbs/hr	Relate to Flow Diagram

Description of Waste Municipal Wastes collected in the City of Tampa

Total Weight Incinerated (lbs/hr) 8.3×10^4 Design Capacity (lbs/hr) 8.3×10^4

Approximate Number of Hours of Operation per day 24 days/week 7

Manufacturer International Incinerators, Inc.

Date Constructed 1967 Model No. _____

*Waste Quantities and Composition in Appendix G.

	Volume (ft) ³	Heat Release (BTU/hr)	Fuel		Temperature (°F)
			Type	BTU/hr	
Primary Chamber	N/A	3.56×10^8	Solid Waste	3.75×10^8	1600 - 1800°F
Secondary Chamber					

Stack Height: 164 ft. Stack Diameter 7.5 ft. Stack Temp. (477°K) 400°F
 Gas Flow Rate: About 100,000/unit ACFM .03 gr/ DSCFM* Velocity 70 FPS

*If 50 or more tons per day design capacity, submit the emissions rate in grains per standard cubic foot dry gas corrected to 50% excess air.

Type of pollution control device: Cyclone Wet Scrubber Afterburner Other (specify) See Below

Brief description of operating characteristics of control devices: Deivise to achieve lowest achievable emission rate probably an Electrostatic Precipitator.

Ultimate disposal of any effluent other than that emitted from the stack (scrubber water, ash, etc.):

Cooling tower and boiler blowdown to sanitary sewer.

Ash to permitted Landfill.

SECTION V: SUPPLEMENTAL REQUIREMENTS

Please provide the following supplements where required for this application.

1. Total process input rate and product weight – show derivation.
2. To a construction application, attach basis of emission estimate (e.g., design calculations, design drawings, pertinent manufacturer's test data, etc.) and attach proposed methods (e.g., FR Part 60 Methods 1, 2, 3, 4, 5) to show proof of compliance with applicable standards. To an operation application, attach test results or methods used to show proof of compliance. Information provided when applying for an operation permit from a construction permit shall be indicative of the time at which the test was made.
3. Attach basis of potential discharge (e.g., emission factor, that is, AP42 test).
4. With construction permit application, include design details for all air pollution control systems (e.g., for baghouse include cloth to air ratio; for scrubber include cross-section sketch, etc.).
5. With construction permit application, attach derivation of control device(s) efficiency. Include test or design data. Items 2, 3, and 5 should be consistent: actual emissions = potential (1-efficiency).
6. An 8½" x 11" flow diagram which will, without revealing trade secrets, identify the individual operations and/or processes. Indicate where raw materials enter, where solid and liquid waste exit, where gaseous emissions and/or airborne particles are evolved and where finished products are obtained.
7. An 8½" x 11" plot plan showing the location of the establishment, and points of airborne emissions, in relation to the surrounding area, residences and other permanent structures and roadways (Example: Copy of relevant portion of USGS topographic map).
8. An 8½" x 11" plot plan of facility showing the location of manufacturing processes and outlets for airborne emissions. Relate all flows to the flow diagram.

9. An application fee of \$20, unless exempted by Section 17-4.05(3), F.A.C. The check should be made payable to the Department of Environmental Regulation.
10. With an application for operation permit, attach a Certificate of Completion of Construction indicating that the source was constructed as shown in the construction permit.

SECTION VI: BEST AVAILABLE CONTROL TECHNOLOGY

- A. Are standards of performance for new stationary sources pursuant to 40 C.F.R. Part 60 applicable to the source?
 Yes No

Particulate	Contaminant	Rate or Concentration
		0.08 gr/dscf at 12% CO ₂

- B. Has EPA declared the best available control technology for this class of sources (If yes, attach copy) Yes No

Contaminant	Rate or Concentration

- C. What emission levels do you propose as best available control technology?

Contaminant	Rate or Concentration
all emission but particulate	at potential to emit rate - without controls
See Chapters 3 and 4	

- D. Describe the existing control and treatment technology (if any). None

1. Control Device/System:
2. Operating Principles:
3. Efficiency: *
4. Capital Costs:
5. Useful Life:
6. Operating Costs:
7. Energy:
8. Maintenance Cost:
9. Emissions:

Contaminant	Rate or Concentration

*Explain method of determining D 3 above.

*See Chapter 6

10: Stack Parameters.

c. Flow Rate:	100,000/unit	ACFM	d. Temperature:	400°F	°F	
e. Velocity:	70	FPS				

E. Describe the control and treatment technology available (As many types as applicable, use additional pages if necessary).

1.

- a. Control Device: wet scrubbers - for SO₂, HF, and gaseous Hg control
- b. Operating Principles: gas intimately contacted with lime slurry. SO₂ and HF react and are removed. Hg condenses and is removed.
- c. Efficiency*: 90% or better; literature
- d. Capital Cost: \$5,280,000
- e. Useful Life: 20 year
- f. Operating Cost: \$643,000/yr.
- g. Energy*: 460 kwh; literature
- h. Maintenance Cost: \$528,500/yr
- i. Availability of construction materials and process chemicals:
available with appropriate lead time
- j. Applicability to manufacturing processes: has not been used on U.S. solid waste incinerator
- k. Ability to construct with control device, install in available space, and operate within proposed levels:
Could be installed and operated on space available. Has not been done on U.S. Solid Waste Incinerator.

2.

- a. Control Device: Dry scrubber - SO₂, HF and gaseous Hg control
- b. Operating Principles: lime slurry contacts gas and is dried by flue gas. Particulate control by baghouse on ESP
- c. Efficiency*90-99%; literature
- d. Capital Cost: \$7,920,000
- e. Useful Life: projected for 20 years
- f. Operating Cost: \$322,000/yr
- g. Energy**: 482 kwh; literature
- h. Maintenance Costs: \$264,000/yr
- i. Availability of construction materials and process chemicals:
Available with appropriate lead time
- j. Applicability to manufacturing processes: has not been used on any combustion source in U.S. First unit to start up soon on coal-fired boiler
- k. Ability to construct with control device, install in available space, and operate within proposed levels:
Room to Construct. yet to be proven

*Explain method of determining efficiency.

**Energy to be reported in units of electrical power – KWH design rate.

3.

- a. Control Device: low sulfur fuel - SO₂ control
- b. Operating Principles: lower sulfur content in fuel, lower SO₂ emission
- c. Efficiency*: -
- d. Capital Cost: -
- e. Life: -
- f. Operating Cost: -
- g. Energy: .0
- h. Maintenance Cost: -

*Explain method of determining efficiency above.

- i. Availability of construction materials and process chemicals:
 - j. Applicability to manufacturing processes:
 - k. Ability to construct with control device, install in available space and operate within proposed levels:
 - a. Control Device ammonia injection, wet scrubbers and catalytic reduction for NO_x control
 - b. Operating Principles:
 - A laboratory control device - Described in Chapter 4
 - c. Efficiency*:
 - d. Capital Cost:
 - e. Life:
 - f. Operating Cost:
 - g. Energy:
 - h. Maintenance Cost:
 - i. Availability of construction materials and process chemicals:
 - Not proven on any combustion source, not recommended
 - j. Applicability to manufacturing processes:
 - k. Ability to construct with control device, install in available space, and operate within proposed levels:

F. Describe the control technology selected:

1. Control Device: No additional collection device
 2. Efficiency*: 0
 3. Capital Cost:
 4. Life:
 5. Operating Cost:

CHAPTER 3

AIR QUALITY ANALYSIS

AIR QUALITY ANALYSIS

The purpose of air quality analysis is to determine the effects this Project will have on the surrounding area and the attainment status of that area. This is done first determining a good estimate of the emissions from the Project, then modeling the emissions from this facility and finally adding the modeled emissions to the existing background concentration. The area of air quality analysis is less than a precise science and assumptions must be made. These assumptions include the use of air quality models. A fundamental assumption used in the analysis is that the facility is operating at full load, all day, everyday. This will lead to a more conservative analysis than will actually exist.

Facility Emissions and Monitoring

The emissions information for Facility 1 was obtained from Waste Management, Inc. (WMI), the current Volund technology licensee. The data represents the highest value obtained from stack tests done worldwide (see Appendix I). The expected emissions are shown in Table 3-1. The Project's emissions are compared to the PSD significance levels in Table 3-2.

Table 3-1
Emissions Expected from Project

	Facility 1 gm/s	TPY	Facility 2 gm/s	TPY	TOTAL TPY
Particulate (uncontrolled)	575	19970	400	13890	27350

Worst 24-hour day - Day 175, 1972

*NV = No Value

The data in Table 3-2 indicate that the McKay Bay Refuse-to-Energy Project (Project) will be a major source for sulfur dioxide, carbon monoxide, nitrogen oxides, and a significant source for lead, mercury, hydrocarbons, beryllium and fluoride. Based on the modeled impacts, monitoring data will be required for sulfur dioxide, lead and flourides.

To fulfill the monitoring requirements for sulfur dioxide and lead Hillsborough County Environmental Protection Commission (HCEPC) monitors have been used. Figure 3-1 shows the monitor location used in the analysis. The monitors are within the area of maximum impact. These monitors adequately reflect the air quality in the area except when the wind is from the southwestern quadrant. With southwesterly wind the effect of TECO's Gannon and Hooker's Point Powerplants and General Portland Cement Plant will be missed. To account for their effect these plants were modeled for specific days which coincided with the southwesterly quadrant maximum days and the impacts added to the Project's impact and the ambient concentrations.

3 - 3

FIGURE
3 - 1

The preamble to the August 7, 1980 PSD Rules states that, "For the noncriteria and hazardous pollutants, modeling, not monitoring, will be the mechanism used to perform most detailed air quality analyses. However, there may be circumstances where monitoring may be the only plan available to perform an adequate analysis ...", FR 52724, August 7, 1980 (in Appendix J). The fluoride impact (in Table 3-2) is significant by the PSD rules, but negligible when compared to the Threshold Limiting Value (TLV) of 2 mg/m³. Negotiations with the Florida DER have concluded that monitoring will not be required for fluorides.

For acceptance testing at least EPA method 5 will be used. Any other emission test requested by the DER or EPA will also be performed.

Modeling

The CRSTER model was used to determine the effect of the sulfur dioxide emissions. These values were modified to develop modeled effects of the other pollutants. The meteorological input data was supplied by both the Florida Department of Environmental Regulation and the National Climatic Center (NCC). To reformat the NCC data to a form acceptable to the CRSTER, the preprocessor program RAMMET was used.

The modeled situation was six stacks colocated at Facility 1. The six stacks represent the four flues from Facility 1 and two flues from Facility 2. The parameters used are shown in Table 3-3. The ring distances were developed by the procedure outlined in the "Proposed Guideline to Air Pollution Models".

Table 3-3
Stack Parameters Modeled for Sulfur Dioxide

<u>Stack</u>	<u>Emission Rate (gm/s)</u>	<u>Stack Height (m)</u>	<u>Stack Diameter (m)</u>	<u>Exit Velocity (m/sec)</u>	<u>Exit Temp. (°K)</u>	<u>Volumetric Flow Rate (m³/s)</u>
Facility 1

4	5.2	45.72	1.35	21.3	500	30.49
Facility 2						
1	10.4	50.00	1.84	18.3	477	48.66
2	10.4	50.00	1.84	18.3	477	48.66

Ring Distances (km)= 0.5, 1.0, 1.2, 1.7, 2.2, 2.9, 3.8, 5.0, 6.6, 9.0

Impact Area

Based on the CRSTER model evaluation of 1970-74 the worst annual impact occurs in 1970. The impact area is shown in Figure 3-2 by a 10.2 km radius circle. The actual area of the 1 ug/m³ impact is also shown on Figure 3-2.

Emission Inventories

The only facilities specifically inventoried were TECO's Gannon and Hooker Point Power plants, and General Portland Cement Plant. Additional data was obtained from the CONSRV PSD application recently submitted to DER. The TECO emissions were updated by conversations with TECO personnel. Other inventories were obtained from local agencies and are shown in Appendix A and B.

Sulfur Dioxide Analysis

Hillsborough County is presently an attainment area for sulfur dioxide. All of the monitoring data presented was developed by the Hillsborough County Environmental Protection Commission (HCEPC) and is presented in Appendix C. The data is summarized annually in the HCEPC Environmental Quality series. Table 3-3 presents a summary of the sulfur dioxide monitoring data for 1978 and 1979.

Table 3-4
Sulfur Dioxide
(micrograms/cubic meter)
1-hr Averages from Continuous Analysis

1978

Station	# of Observations	Minimum Value	Arithmetic Mean	Geometric Mean	Maximum Value
63	7803	2.6	25.7	14.3	584
115	4158	2.6	22.2	10.3	342

1979

Station	# of Observations	Minimum Value	Arithmetic Mean	Geometric Mean	Maximum Value
63	7066	2.6	19.6	10.8	540
115	6466	2.6	25.6	12.3	525

The modeled impacts of the sulfur dioxide emissions are shown in Tables 3-5, 3-6 and 3-7. These values represent the highest values for each of the eight compass direction over the five years of modeling. Included in Tables 3-6 and 3-7 are some of the meteorological parameters associated with the modeled day and the day from which the monitored data was chosen. Every effort was taken to find the closest calendar day and similar wind characteristics so that seasonal variations would be

minimized. As a practical matter the high and 2nd high seldom differed by more than 3%.

Table 3-5
Sulfur Dioxide
Maximum Modeled Annual Impacts
(micrograms/cubic meter)

Direction	Concentration	Distance
N	0.7	1.7
NE	1.0	1.2
E	2.2	1.2
SE	0.8	2.9
S	0.7	2.9
SW	1.2	2.2
W	1.9	2.2
NW	1.2	1.7

The highest three hour impact occurs southwest of the Project. In this case the Project, TECO's Hooker Pt. Powerplant and General Portland Cement Plant are upwind of the Davis Island monitor, Station 63.

If the modeled impact from the Project is added to the highest monitored three hour value, a highest 3 hr. ambient concentration of 178 ug/m³ occurs. This is significantly below the 3 hr. NAAQS of 1300 ug/m³. The Project is modeled to provide 55 ug/m³ of this amount. The highest three hour impact from the Project alone was modeled to be 77 ug/m³ at 1.2 km east of the Project.

The highest ground level concentration is computed by adding the highest 24-hour southwest impact to the monitored data indicates a worst 24-hour average of 72 ug/m³. The Projects highest twenty-four hour impact is predicted to be 24 ug/m³ 2.2 km east of the Project.

*ND = No Data

The highest annual impact is 1.2 km to the east in 1974 with a value of 2.2 ug/m³. The annual impacts for 1970-1974 varied from 1.3 to 2.2 ug/m³. The monitored annual arithmetic average were 25.7 and 19.6 ug/m³ in 1978 and 1979 respectively at station 63. Station 115 registered annual averages of 22.2 and 25.0 ug/m³ in 1978 and 1979 respectively. The summation of the annual impact and the monitored annual average leads to a highest annual concentration of about 30 ug/m³. This is significantly below the federal secondary standard of 80 ug/m³ and the Florida Standard of 60 ug/m³.

There are significant sulfur dioxide sources to the east of the Project site. The recent CONSRV PSD application analysed the impact it plus other significant sources would have in various directions. The CONSRV case VI analysed a SSE wind. This would align several facilities with the project site. The CONSRV results indicate that there would be essentially no impact from those facilities on the projects impact area.

The only other increment consuming source affecting the impact area is TECO's Gannon Powerplant. This powerplant is modifying its fuel and was granted a PSD permit around the first of the year. A letter from EPA to Mayor Bob Martinez of a Public Notice of the change is found in Appendix E. The Public Notice indicated that the maximum increment consumed by the proposed modification is as follows:

	Annual	24 Hour	3 Hour
SO ₂	5 %	38 %	32 %

A condensation of Tables 3-5, 3-6, and 3-7, shows that the project's maximum increment consumption of the total allowed will be:

<u>Annual</u>	<u>24 Hour</u>	<u>3 Hour</u>
2.1 ug/m ³	22 ug/m ³	77 ug/m ³
or	or	or
11 %	24 %	15 %

Baseline was set by the TECO modification. There are two new PSD sources proposed for Hillsborough County, CONSRV and the McKay Bay Refuse-to-Energy Project. CONSRV's data indicates no impact on the Project's impact area and TECO's impact was given above. Table 3-8 shows our projection of the increment that has or will be consumed.

Table 3-8
Total Increment Consumed

	Annual ug/m ³	Percent	24 Hour ug/m ³	Percent	3 Hour ug/m ³	Percent
McKay Bay	2.1	11	22	24	77	15
CONSRV	0	0	0	0	0	0
TECO	<u>1.0</u>	<u>5</u>	<u>35</u>	<u>38</u>	<u>164</u>	<u>32</u>
Total	3.1	16	57	62	341	47
Allowed	20		91		512	

Table 3-9 shows the increment used by the project and TECO added to the HCEPC monitored ambient conditions. This assumes that the ambient maximums plus both source maximums occur at the same place and time.

Florida	50	265	1300

Summary of Sulfur Dioxide Analysis

As was shown in Tables 3-8 and 3-9 the McKay Bay Refuse-to-Energy Project will not violate the Class II increments nor will it lead to a violation of either national or state ambient air quality standards.

Lead Analysis

The ambient lead values have exceeded the NAAQS of 1.5 ug/m³ on a quarterly average in the past but the most recent data does not indicate an attainment problem. The highest ambient lead value consistently occurs at station 92 (the intersection of Hwys 60 and 41). In the past year the situation has significantly improved. This is shown in Table 3-10.

Table 3-10
Lead in Suspended Particulate Matter
Quarterly Average in Micrograms/Cubic Meter

	Station Number	1	Quarter 2	3	4	Annual Average
1978						
Health Dept.	1	0.6	0.6	2.0	0.9	1.0
Davis Island	63	0.3	0.4	0.7	0.6	0.5
Hwys 60 & 41	92	0.8	1.3	2.4	1.4	1.5

Hooker's Pt.	115	0.6	0.5	0.5	0.4	0.5
1980 - 1981						
Health Dept.	1	0.43	0.5	0.35	0.23	0.38
Davis Island	63	0.15	0.24	0.2	0.14	0.18
Hwys 60 & 41	92	0.60	0.93	0.74	0.44	0.68
Hooker's Pt.	115	0.14	0.26	0.6	0.28	0.32

The CRSTER model does not generate 90 day averages. To demonstrate the insignificance of the lead emissions on Station 92 the the highest 24-hour value will be used.

The highest annual sulfur dioxide value determined in 5 years of modeling occurs due east of the Project site near Station 92 and is 24 ug/m³. The impact of lead can be proportioned by comparing the emission rates of lead to sulfur dioxide. The Project will emit 32.6 TPY of lead and 1142 TPY of sulfur dioxides. The lead impact will be 32.6/1142 or 2.9% of the sulfur dioxide impact. Thus the lead concentration at Station 92 is modeled to be 0.70 ug/m³. When added to the past years highest quarterly average of 0.93 ug/m³ value barely exceeds the standard. This assumes the highest 24-hour average modeled over 5 years would somehow be a quarterly average.

Summary - Lead Analysis

Based on the data this Project will not endanger the National Ambient Air Quality Standard of 1.5 ug/m³.

Carbon Monoxide Analysis

To determine the highest concentration of carbon monoxide attributable to the Project, the concentration modeled for sulfur dioxide will be proportioned by the emission rates 258 TPY/1142 TPY or 23% of the sulfur dioxide value. Table 3-11 shows the modeled impacts of the Project. To best utilize our modeling for a conservative analysis, the 8-hour values are actually the values modeled for a 3-hour average.

Table 3-11
Maximum Carbon Monoxide Concentrations
(micrograms/cubic meter)

	N	NE	E	SE	S	SW	W	NW
8 Hour (3-hr.)	12	17	18	10	11	13	17	15
1 Hour	21	23	22	19	19	23	23	23

The carbon monoxide NAAQS standards are 40,000 and 10,000 ug/mg for 1 hour and 8 hour average respectively. The area is attainment for carbon monoxide. The Project will not have a significant impact on the ambient levels of carbon monoxide.

Flouride Analysis

By proportioning the respective emission rates the modeled data can be used to determine the highest concentration of fluorides expected from the Project. The fluoride concentration should be 32.6 TPY/1142 TPY or 2.8% of the sulfur dioxide concentration. The maximum 1-hour concentration is modeled to be 2.8 ug/m³. The Occupational Safety and Health Administration threshold limiting value (TLV) for hydrogen fluoride is 2.0 mg/m³. The Project's impact is less than 2/10 of 1% of the TLV, and will not be significant.

Nitrogen Oxides

The Hillsborough Environmental Protection Commission data indicate that the highest annual average between 1975 and 1979 is 68 ug/m³ in 1977. By proportioning the modeling results by the emission rates the nitrogen oxides are equal to 1233 TPY/1142 TPY or 108% of the sulfur dioxide values. The maximum annual nitrogen oxide impact is modeled to be 2.4 ug/m³. This value added to the highest annual average gives a maximum annual concentration of 70 ug/m³. When compared to the federal standard of 100 ug/m³ it can be seen that the area will remain attainment for nitrogen oxides.

Mercury and Beryllium

The projected impact from the emissions of Mercury and Beryllium were shown in Table 3-2. Their worst impact are 1/3 and 1/8 of the de minimis values. The de minimis values are determined to be that value below which no impact is assumed to occur and the commitment of applicant and review authority resources would not be productive.

The NESHAP rules for Beryllium (40CFR61.30) require that no more than 10 grams/day be emitted. The conservative data used in these estimates indicate an emission rate of less than seven (7) grams of Beryllium per day. The NESHAP rules for Mercury (40CFR61.50) are applicable to those sources that process mercury ore, use mercury chlor-alkali cells, or dry and/or incinerate wastewater treatment plant sludges. Neither Facility I nor the Facility 2 is planned to process or burn any wastewater treatment plant sludges.

CHAPTER 4

BEST AVAILABLE CONTROL TECHNOLOGY

BEST AVAILABLE CONTROL TECHNOLOGY

Best Available Control Technology (BACT) is defined in the Florida Air Pollution Rules as follows:

"An emission limitation based on the maximum degree of reduction of each pollutant emitted which the Department, taking into account, energy, environmental and economic impacts and other costs, determines on a case by case basis, is achievable through application of production processes and available methods, systems, and techniques, for control of each such pollutant".

The air emission for which an evaluation for BACT was conducted and alternatives considered, both commercially available and in the research stage, control of each of the emissions are shown in Table 4-1.

**TABLE 4-1
BACT POLLUTANTS AND CONTROL ALTERNATIVES**

<u>Air Emission</u>	<u>Control Alternatives</u>
Sulfur Dioxide	Wet Scrubbers Dry Scrubbers Low Sulfur Fuel
Nitrogen Oxide	Ammonia Injection Wet Scrubber Catalytic Reduction Design and Operating Procedures
Carbon Monoxide	Design and Operating Procedures
Lead & Beryllium & Particulate Mercury	Electrostatic Precipitators (ESP) Wet or Dry Scrubbers Fabric Filters
Hydrogen Fluoride & Gaseous Mercury	Wet & Dry Scrubbers

The pollutants and the emission levels for which BACT must be determined are shown in Table 4-2.

TABLE 4-2
BACT POLLUTANTS AND ANNUAL EMISSIONS

<u>Air Emission</u>	<u>Tons/Year</u>
Sulfur Dioxide	1142
Nitrogen Oxide	1233
Carbon Monoxide	258
Lead	32.6
Beryllium	2.8×10^{-3}
Mercury (particulate & vaporous)	3.76
Hydrogen Fluoride	32.6

The evaluation of the above described control alternatives considered technical feasibility, energy usage and environmental factors. The proposed facilities are projected to be on-line approximately 80-85% of the time. Air pollution control equipment must be reliable to minimize contributions to facility downtime. A projection of the equipment's reliability can be developed only after equipment has received commercial application; therefore, commercial application of the equipment was reviewed in formulating BACT. Installation of air pollution control equipment increases the facility cost but results in benefits to the surrounding area and population. At some point, the cost of air pollution control equipment is not outweighed by the resulting benefits. To this end the costs, capital, operational and energy, were compared to the benefits. Air pollution control equipment will provide for cleaner facility air emissions; however, a waste requiring land disposal resulting from the operation of the equipment is not advantageous.

Sulfur Dioxide

Best available control technology alternatives for sulfur dioxide control are wet scrubbers, dry scrubbers, and low sulfur fuel.

Wet scrubbers generally operate by obtaining intimate contact between the flue gas and a lime slurry. Sulfur dioxide reacts with the lime forming calcium sulfate and calcium sulfite. The calcium sulfate and calcium sulfite are removed as a slurry and must be disposed of. Particulate removal devices need to be installed upstream from the wet scrubber. Wet scrubbers are utilized on coal-fired power plants in the United States and removal efficiencies of 90% and above have been obtained. This technology has not been utilized on solid waste fired facilities in the United States. The costs and effects presented later are based upon interpretations of experience at coal-fired facilities and from discussions with equipment vendors.

Dry scrubbers operate by injecting droplets of alkali reagent into the flue gas. The resulting reactions remove the sulfur dioxide as sulfites and sulfates in particulate form. The heat generated during the reaction plus flue gas heat evaporates the water carrying the alkali reagent. A particulate removal device is located downstream to remove the sulfate and sulfite particulates. Dry scrubbers have not yet operated on a commercial basis in the United States on solid waste incinerators. The first commercial scale dry scrubber has just gone on-line at the coal-fired Northern States Power Company's Riverside Power Plant in Minneapolis, Minnesota. The system's costs and effects were based upon projections provided by system vendors.

The emission rate of sulfur dioxide is dependent on the amount of sulfur in the fuel. The solid waste is estimated to have a sulfur content of less than 0.2%. Generally, coal-fired facilities have switched from high (5-7%) to low sulfur coal (1-2%) to comply with laws and regulations. The proposed facilities will utilize municipal solid waste which is low in sulfur content.

The general effects of each sulfur dioxide control alternative are summarized in Table 4-3.

TABLE 4-3
EFFECT OF SO₂ CONTROL ALTERNATIVES

<u>Area of Effect</u>	<u>Wet Scrubbers</u>	<u>Alternatives</u> <u>Dry Scrubbers</u>	<u>Low Sulfur Fuel</u>
Energy	Increased facility energy consumption	Increased facility energy consumption	No effect
Environmental	Reduced emissions of SO ₂ , HF & gaseous mercury; increased amounts of residues requiring land disposal.	Reduced emissions of SO ₂ , HF and gaseous mercury; increased amounts of residues requiring land disposal.	Reduced emissions of SO ₂
Economic	Increased facility capital and operating costs.	Increased facility capital and operating costs.	No direct facility related costs

An economic analysis of wet and dry scrubbers for two-1,000 TPD facilities is presented in Tables 4-4 and 4-5 respectively. The parameters of procedures and calculations used in the economic evaluation are found in Appendix F.

The energy affects of a wet scrubber will be an increased electrical power consumption of 6,609,000 KW per year while the dry scrubber will consume an additional 8,446,000 KW per year. The electrical power may be provided by the facility thus reducing the power revenues. Using a 1984 electricity cost of 6.5 cents/kwh, the lost revenues would be about \$131,000/year with a wet scrubber and \$87,000/year with a dry scrubber.

The wet scrubber will generate approximately 15,500 tons per year of sludge at 70% solids. Assuming a solids content of 70% after dewatering, the sludge will fill a volume of approximately 10 acre ft./year. The weight and density of the waste from a dry scrubber could not be accurately estimated from information available. For

this analysis, the waste from a dry scrubber was assumed to approximate the dry weight of the waste generated by a wet scrubber.

The utilization of wet or dry scrubbers will have significant adverse affects on the facilities revenue, will increase the facilities energy consumption, and will require significant amounts of land for waste disposal. The incremental effects of decreases in SO₂ on the environment were not quantifiable in monetary terms. The impact of SO₂ without control by wet or dry scrubbers are presented in Chapter 7 of this application and are considered to be minimal.

The cost of energy and environmental effects of wet and dry scrubbers, when compared with the minimal decrease in projected SO₂ emissions, results in the BACT recommendation being the use of low sulfur fuel, solid waste.

**TABLE 4-4
ECONOMIC EVALUATION
WET SCRUBBERS FOR SO₂ CONTROL**

For Both Refuse to Energy Facilities

Cost Category	Dollars/Yr.
Equipment Amortization	1,369,200
Electrical Power	264,000

Waste Disposal	102,000
Labor	88,000
Maintenance	792,000
Total Annual Costs	\$3,611,000
Cost Per Ton of Solid Waste	\$6.03
Cost Per Ton of Sulfur Removed	\$3,008

Nitrogen Oxide

The technologies for nitrogen oxide (NO_x) control, ammonia injection, wet scrubbers, and catalytic reduction, have not been utilized on a commercial scale at either resource recovery facilities or coal-fired power plants in the United States.

Research relative to ammonia injection has delineated the following utilization limiting factors:

- When the temperature is between 1600°F and 1800°F, the reaction:

readily takes place controlling NO emissions. Above 1800°F the NH₃ is oxidized to NO. Below 1600°F the reaction does not take place. To maintain the appropriate temperature envelope range may require a supplemental heating source.

- Ammonia can react with sulfur trioxide in the flue gas to form ammonium sulfate or ammonium bisulfate. Ammonium bisulfate can condense after emission to the atmosphere and act as a corrosive agent.
- Cyanide formation at the ammonia injection zone has occurred in the presence of hydrocarbons.

Research on nitrogen oxide control with catalytic reduction processes has identified the following problems:

- Formation of ammonium bisulfate with the resulting corrosivity problems
- Blinding of the catalyst
- Catalyst corrosion
- Formation of unexpected compounds

The wet scrubber has been demonstrated only on a glass manufacturing furnace. Furthermore, the information is insufficient, in our opinion, to judge its applicability to a solid waste fired resource recovery facility.

Nitrogen oxides (NO_x) result from the reaction of atmospheric nitrogen and oxygen in the combustion zone and the partial combustion of nitrogenous compounds in the fuel. Important factors affecting NO_x production are flame and furnace temperature, residence time of combustion gases at flame temperature, rate of gas cooling, and amount of excess air.

Given the state of the art of NO_x control technologies and the importance of combustion zone parameters in NO_x generation, the BACT recommendation for the proposed resource recovery facilities is the use of proper boiler design and operating procedures.

Carbon Monoxide

The generation of carbon monoxide is dependent upon the same factors as will be described in Chapter 5 for hydrocarbons. The BACT recommendation is state-of-the-art boiler design and operating procedures with the same basis as the lowest achievable emission rate (LAER) recommendation for hydrocarbons.

Particulate Lead, Beryllium and Mercury

Emissions of the particulate form of lead, beryllium, and mercury can be controlled by an ESP. An ESP is planned to obtain LAER for total suspended particulate emissions; consequently, the BACT recommendation is an ESP.

Hydrogen Fluoride & Gaseous Mercury

The equipment available to remove these emissions from the flue gas is of the type used to control sulfur dioxide (i.e. dry and wet scrubbers). It has been proposed that acid gases may be removed preferentially to a sulfur dioxide in some dry scrubber systems. The technologies available for control Hydrogen Flouride and gaseous mercury emissions are the same as those for control of sulfur dioxide emissions, therefore, the BACT analysis in this chapter is applicable. The minimal health effects of these emissions (see Chapter 7) do not warrant the use of these expensive control technologies. The recommended BACT for control of Hydrogen Flouride and gaseous mercury emissions is proper operating technique and facility design.

CHAPTER 5

LOWEST ACHIEVABLE EMISSION RATE

LOWEST ACHIEVABLE EMISSION RATE

Hillsborough County, Florida is a non-attainment area for emissions of hydrocarbons and total suspended particulate matter (TSP). Due to the levels of emissions from the proposed McKay Bay Refuse-to-Energy Project (see Table 3-1) Lowest Achievable Emission Rate (LAER) technology will be required for control of these emissions. This section describes the technologies which were reviewed for control of non-attainment pollutants from the facilities. The scope and format of the evaluation was drawn from the local, State, and Federal rules, regulations and guidelines regarding LAER.

LAER is defined in the Federal Clean Air Act as follows:

"The most stringent emission limitation which is contained in the implementation plan of any State for such class or category of source, unless the owner or operator of the proposed source demonstrates that such limitations are not achievable;

or

the most stringent emission limitation which is achieved in practice by such class or category of source, whichever is more stringent".

The air pollution rules of every State were reviewed for particulate emission standards for solid waste incinerators. Illinois has the second lowest emission limit at 0.05 gr/dscf. Several facilities in the Chicago area are meeting this standard. California has the lowest emission limit at 0.01 - 0.02 gr/dscf; however, no facilities have been built under these conditions. The BACT/LAER Clearinghouse reports have one entry under solid waste boilers with an emission rate of 0.006 gr/dscf. It was for a National Energy Corp. facility in Chicago. A conversation with Mr. Thajil of EPA Region V confirmed the report to be in error since the facility was never built. The state rules concerning incinerators are summarized in Appendix K.

The technologies available for the removal of particulates can be grouped into three categories; electrostatic precipitators, fabric filters or baghouses, and wet scrubbers. Characteristics of each group of technology are presented below:

Electrostatic Precipitators

- Generally capable of particulate removal efficiencies greater than 98% with efficiencies as high as 99.8% attained.
- Capital costs are generally higher relative to other emission control technology.
- Can handle high temperature gases, up to about 500°F.
- Low pressure drop through units resulting in lower energy usage by fans.
- No wastewater disposal requirements.
- Performance is sensitive to actual vs. design flue gas flow rates and particle resistivity.
- Consideration must be given to prevention of corrosion caused by acid gas condensation. Acid mist condensation begins about 300°F.
- Recognized as the most reliable and efficient technology on resource recovery systems.

Fabric Filters (Baghouses)

- Particulate removal efficiencies as high as 99.8% have been demonstrated on coal fired units.
- No wastewater disposal requirements.
- Variations in flue gas flow rate and particulate composition do not generally effect performance.
- Pressure drop through units is significant resulting in relatively high energy usage by fans.
- Available proven filter materials limit operating temperatures to approximately 500° F.
- Sparks in flue gas can cause fires within the filter.
- Consideration must be given to prevention of corrosion caused by acid gas condensation.
- Experience on resource recovery facilities is very limited.

Wet Scrubbers

- Particulates and gaseous emissions can be controlled simultaneously; however, high particulate removal efficiencies (over 95%) require high energy inputs.
- Discharge of the water saturated gas generally produces a visible vapor plume.
- Operating and maintenance costs are generally higher relative to other air emission control technology; however, capital costs are generally lower.
- Wastewater must be disposed of.
- Corrosion and erosion problems are present.
- Limited success in resource recovery systems.

Table 5-1 presents the particulate control technology utilized at some U. S. solid waste incinerators and the respective emission rate. Table 5-2 presents similar information for European solid waste incinerators all having electrostatic precipitators. It should be noted that only one European solid waste incinerator located in Switzerland utilizes a fabric filter for particulate control. As the tables show ESP's are the predominant technology for particulate control at solid waste incinerators.

Based upon the review of published reports and information obtained from American solid waste/resource recovery vendors, a particulate LAER of 0.03 gr/dscf at 50% excess air is recommended for the McKay Bay project to be achieved with electrostatic precipitators. A recent PSD permit issued in Region I for a Thermal Conversion Facility in Lawrence, Massachusetts recommend a LAER of no more than 0.03 gr/dscf.

The capital cost for the electrostatic precipitators cannot be accurately determined prior to the finalization of the Procurement documents. The range for total installed ESP costs for each facility will be from \$4.5 - 6.5 million.

Technology is not commercially available for the control of volatile organic compounds or hydrocarbons from solid waste fired facilities. Hydrocarbon emissions result from the heterogeneous nature of the solid waste fuel, variations in the fuel firing rates and incomplete combustion. The average emission rate of hydrocarbons from solid waste fired facilities is 0.27 lbs. per ton of solid waste.

Operating procedures which minimize the emission of hydrocarbons also contribute to increased facility efficiency. For instance, the more complete the combustion, the higher the efficiency leading to more profitable operation. Hydrocarbon emissions will be minimized through facility design for higher efficiency and lower emissions.

CHAPTER 6

OFFSETS

OFFSETS

The Project is located in nonattainment areas for ozone and total suspended particulate matter. The ozone nonattainment area is the entire county. The particulate nonattainment area is a 12 km radius circle with its center at the intersection of Hiways 41 and 60. The New Source Review rules for sources locating a nonattainment area require that offsets be obtained before a permit can be issued.

Since ozone is a secondary pollutant, offsets are required in the hydrocarbon precursors. The City of Tampa proposes to use the New Source Allowance presented in FAC 17-2-17(7) to provide offsets for hydrocarbon emissions. The hydrocarbon emissions are expected to be 32 TPY from Facility I and 32 TPY from Facility II. The total of 64 TPY places the project in the New Source Review category. The New Source Allowance available for Hillsborough County in 1981 is 500 TPY. This is far in excess of the offsets needed by the McKay Bay Refuse-to-Energy Project. We request that 64 TPY be credited from the New Source allowance to this Project.

As stated earlier (see Chapter 3), particulate emissions from both facilities will be 269 tons per year. This level places the McKay Bay Refuse-to-Energy Project in tier 2 for nonattainment review, and makes it necessary for the project to obtain offsets for its particulate emissions.

The City of Tampa is proposing the following three pronged approach for obtaining offset for the refuse-to-energy facilities.

1. Attempt to obtain all available offsets in the area.
2. Secure the resource recovery exemption.
3. Revise the State Implementation Plan to allow use of closed Incinerators offsets.

To obtain all available particulate offsets the City has sent a letter (Figure 6-1) to each major source listed in the present Emission Inventory of Hillsborough County and located within the nonattainment area. These sources each emit more than 100 TPY of TSP. The letter solicits offsets that may be available from these facilities in the nonattainment area and any positive response will be investigated.

The second step is to use the Resource Recovery Exemption as stated in FAC 17-2.17(3)C. This states that offsets will not be required to issue a permit if all available offsets have been obtained, the applicant has made its best effort, and the applicant will continue obtaining offsets as they become available.

Each major source has been contacted and the results are not yet in. The third step is the altered State Implementation Plan that was just approved by the HCEPC board. The new wording allows the use of the offsets from the old incinerator be applied to the project. We feel this will satisfy the offset requirements.

July 10, 1981

Dear :

The local governments, with the City of Tampa as the lead agency, have embarked on an aggressive plan to dispose of solid waste by incineration with recovery of heat energy and production of electricity. This plan would involve a conversion of the existing Tampa Municipal Incinerator and the construction of a second, new refuse-to-energy facility at the Incinerator site.

The State of Florida non-attainment air emissions regulations require offsets for emissions on non-attainment pollutants from sources locating in non-attainment areas. Because the Incinerator site is located within a Total Suspended Particulate matter (TSP) non-attainment area, offsets for TSP emissions will be required.

By this letter, the City of Tampa is seeking TSP offsets from available sources. If your firm possesses available TSP offsets from reduced emissions at your facility, or from other means, please contact Joe Murdoch at 813-223-8090.

Your time and consideration are appreciated.

Sincerely,

Dale H. Twachtmann, Administrator
Water Resources & Public Works

CHAPTER 7

SOILS, VEGETATION AND LAND USE

SOILS, VEGETATION AND LAND USE

Growth Analysis

A Hillsborough County City-County Planning Commission publication entitled, "Population and Housing Estimates", April 1, 1970 - April 1, 1980 projects the population of Hillsborough County to increase from 630,698 to 757,300 persons from 1980 to 1985. This increase of 126,602 people represents a 20% increase in 5 years. The future projections continue to the year 2000 with an estimated increase of 63% within 20 years. For the McKay Bay Refuse-to-Energy project of the rehabilitation of the present Tampa Bay incinerator and the construction of a new facility, the workforce is expected to average between 150 to 300 persons throughout the construction phase. With the present and past construction in the surrounding area it is likely that the majority of construction workforce will be available locally. There may be some relocation of workers to move closer to the project site but this action should be considered negligible in impact analysis. The 150 persons represent less than .03% of the total population.

A sample of the types and numbers of construction workforce is shown in Table 7-1.

**TABLE 7-1
ESTIMATED CONSTRUCTION WORKFORCE**

Types	Workforce (Construction) (1000 TPD Facility)
Boilermakers	57
Carpenters	42
Electricians	16
Ironworkers	45
Laborers	70
Masons	14
Millwrights	30
Painters	3
Pipefitters	<u>35</u>
	312

For the operation of the facility, a projected employment of 65 persons is anticipated.

A sample of the types and numbers of operations workforce is shown in Table 7-2.

TABLE 7-2
OPERATIONAL STAFF

Types	Workforce (Operations) (1000 TPD Facility)
Supervisory	4
Clerical	2
Operating (shift)	41
Maintenance	10
Security	4
Janitorial	<u>4</u>
	65

These numbers of personnel and types are but a sample of the workforces that could be used for the construction and operations of the facility. While a few key craftsmen and supervisory personnel may not be available from the local market the majority of the workforce should be available thus providing a positive economic impact on the community.

The availability of medium priced single family housing in the Tampa Bay area is considered good and is not expected to be a problem should a portion of the workforce elect to locate in this area.

SOILS, VEGETATION AND LAND USES

OBJECTIVES

This study focuses on the potential impacts on soils, vegetation, and land uses incurred by air emissions associated with the start-up and continued operation of the McKay Bay Refuse-to-Energy Project. This endeavor addresses certain regulatory requirements of the FDER's review process. Air pollutants in this evaluation include total suspended particulate matter (TSP), oxides of nitrogen and sulfur, lead, beryllium and mercury.

STUDY AREA

The study area encompasses over 162 Km² (65 mi²) in west-central Hillsborough County. A very conservative range of impact for air emissions was set at 5 km from the stack; an additional 2 km was provided for buffer zone evaluation; the total boundary is roughly Dale Mabry Hwy. (U. S. 92) to the west, Sulphur Springs (on the Hillsborough River) to the north, the outskirts of Brandon to the east, and the Archie-Greek-Big Bend area to the south.

GENERAL LAND FEATURES

At least 50 percent of the study area is urbanized to some degree. Metropolitan Tampa is located in the north and west quadrants, including the downtown central business district (CBD) (3 km west of the facility). Between the CBD and the plant is located one of the most concentrated industrial areas in the State (Tampa docks, Hookers Point). Immediately north and east of the site are equipment storage lots, warehouse and wholesale establishments, as well as the Crosstown Expressway, under construction; beyond that various residential areas ranging from dense developments to

widely spaced farm areas are found. Southeast of the facilities the land is open, consisting of pine flatwood, prairies and pasture land. Fringing the shores of Hillsborough and McKay Bays and the Palm River are stands of black mangrove. The southwest quadrant of the study area includes open waters of Hillsborough Bay and spoil islands.

The terrain is flat with some gentle undulations. North of the facility, within the Tampa urbanized area, rolling relief is encountered. Maximum and minimum elevations in the study area are 70 feet (in the north quadrant) and sea level (at the Bay).

GEOLOGY AND SOILS

Native soils in the area consist of unconsolidated quartz sands of Appalachian origin. They are impregnated with irregular inclusions of clay, garnet, chert, and phosphorus. During the many periods of glaciation of the Pleistocene, sea level changes reworked the surface sediments producing the topographic features characteristic today (dunes, shorelines, terraces). Within the study area six ancient seas inundated the land to varying degrees. These seas and the current elevation to which each rose are:

Silver Bluff	+10 feet
Pamlico	+25 feet
Talbot	+42 feet
Penholoway	+70 feet
Wicomico	+100 feet
Sunderland	+170 feet

Soil series in the study area correlate well with the surface features produced by these inundations. These soils are classified and described as follows:

1. Well drained, deep sands formed on dunes just inland from ancient shorelines; Lakeland and Blanton series are most common. Soils considered excessively drained are Lakewood, Pomello, and St. Lucie.

2. Terraces between shorelines were flat and vegetated. Being poorly drained, organic material was deposited within the Soil regime. The resultant soils have a fine sandy upper layer underlain by fairly dense organic hardpans. These poorly drained soils, such as the Leon and Immokalee are the most common series in the study area.
3. Along the shores of Hillsborough and McKay Bay are sandy soils which overlay the limestone bedrock. In places, the Tampa limestone is exposed to the surface. These soils, composed primarily of the Ruskin and Adamsville series, are poorly drained and are often swampy. Their spatial distribution corresponds strikingly to the ancient Silver Bluff shoreline.
4. In the eastern portion of the study area are soils which were covered by warm, shallow marine seas during the Pleistocene. This estuarine environment had a profuse animal fauna which contributed much phosphorus on the sea bottom. These soils, such as Cainesville, Arredondo, and Fort Meade types, are loamy fine sands (sometimes containing clay) impregnated with phosphatic materials.
5. Tidal land soils lie seaward of the Ruskin and Adamsville series. These unclassified soils are highly leached and regularly flooded by saline water. Freshwater swamps and cypress domes have unclassified soils of alluvial origin; they are usually submerged in fresh water and are very acidic.
6. In depressions on flat terrain are acidic soils, such as in the Plummer and Rutlege series, which are poorly drained and consist of fine sandy clay loam to sandy clay; calcareous marls are present below the surface.
7. Adjacent to the upper reaches of the Palm River are poorly drained neutral to alkaline sands to sandy clays such as the Manatee and Felda types. These soils occur adjacent to sand overlying calcareous material; dissolution of bedrock may account for their characteristic pH.
8. Pockets of poorly drained dark colored sands of the Ona series are located east of the facility site. These sandy soils are black to gray on

the surface with a brown stained layer approximately 14" beneath the surface.

9. A large amount of native soils in the study area have been disturbed and altered by man's activities. In urban development, surface layers are generally stripped and replaced by backfill materials of various origins. In phosphate mines the overburden has been completely removed down to the bedrock.

VEGETATION

Native vegetation in the study is associated with specific soil classifications. In areas of urban or agricultural usage, non-native species have invaded or are cultivated. Table 7-3 features a compilation of soil and vegetation communities found in the area.

In residential areas plantings of various ornamental species are common; also prevalent, especially in less dense residential subdivisions are backyard gardens. In vacant lots where the native vegetation has been removed, thick coppices of Brazilian pepper are found. Fringing the shores of Hillsborough, McKay Bay and the Palm River are stamps of Black Mangrove.

TABLE 7-3
SOIL AND VEGETATION COMMUNITIES

<u>Soil Classification</u>	<u>Associated Major Community Species</u>
Well drained deep sands	turkey oak, bluejack oak, slash pine, dogwood, hickory
Poorly drained sands over organic hardpans	pine flatwoods (slash pine, palmetto, wire grass)
Poorly drained sands over calcareous substrate	sabal palm, saw palmetto and wire grass
Well drained sands with phosphatic materials	live and laurel oaks, hickory, and pines
Tidal lands	white, black and red mangrove and black needlerush
Freshwater swamps	pond and bald cypress and sweet bay.
Poorly drained acid sands	pine flatwoods (slash pine, palmetto, and wire grass)
Poorly drained neutral to alkaline soils	slash pine, water oaks, and sweet bay.
Poorly drained dark colored sands	pine flatwoods (slash pine, palmetto, and wire grass)
Urban lands	landscape plantings and backyard gardens; commerical/industrial open land is covered by Brazilian pepper.
Agricultural lands	pasture land of bahia grass; some citrus groves (oranges, grapefruit)
Phosphate pits	Abandonned quarries vegetated by pioneer species (mulberry, sweetgum, and oaks).

Agricultural lands lie within the eastern portion of the study area and consist of pastures (generally over the Leon soils), truck farms (on the better soils with phosphatic material), and citrus groves (on well drained sites).

Table 7-4 is a compilation of landscape, agricultural and other non-native species observed in the study area on May 27, 1981; this listing presents only those specimens which commonly occur.

Backyard gardens range from several square feet to an acre in size. The local climate allows for year round planting although tender plants are generally sown in spring only. Vegetables grown include corn, beans (bush, pole, lima, and pinto), peas (English and southern), greens (collards, mustards, lettuce, cabbage, celery), tomatoes, okra, carrots, turnips, broccoli, cauliflower eggplant, and peppers. The most common fruit are strawberries; garden specimens of citrus and avacado are not uncommon.

The land within the study area to the north and west is characterized by urban usage and resultant landscape plantings. Exceptions to this are in scattered parks (oaks, pine, etc.) and along the Hillsborough River Floodplain (cypress, gum, etc.). Immediately surrounding the facility site on disturbed open land are dense coppices of brazilian pepper. The tidal shoreline is fringed by black and red mangroves although the former species is more common. Severe freeze damage to the mangroves and many other tender exotics (e.g. Australian pine, cajeput) resulted from an unusually cold period during January, 1981. East of the study area the land alternates between residential areas (with gardens and landscape plantings), pastures (for Brahman cattle), pine flatwoods, swamps, and disturbed lands (vegetated by brazilian pepper). A few small citrus groves were identified in the far northeast portion of the study area.

SENSITIVE ZONES

The area immediately surrounding the facility consists of open disturbed lands (created by dredging and filling) with some warehouse and other wholesale merchandise structures. The water body just east of this fill area is McKay Bay, an emergent, or man-impacted ecosystem; it is the focal point of many area

conservation groups primarily in conjunction with nesting and/or migratory bird populations. The mangrove ecosystem fringing tidal shores are important natural assets from both a fisheries and storm protection standpoints.

The residential areas 1 km west of the plant, along the Palm River, and near U. S. Highway 41 south of this stream will be the most affected living areas in the study zone. The closest housing, located west of the emission point, is typical of lower income neighborhoods and consist of compact single family and low-rise, multiple family dwelling units.

East of the plant, though some trailer parks are noted, most dwellings are from 5 to 20 years old, of frame or stucco construction, and on lots averaging 1/4 to 1 acre. Outside appearances suggest resident incomes are in the low to middle class standard.

TABLE 7-4
**LANDSCAPE, AGRICULTURE AND OTHER
 NON-NATIVE SPECIES**

Common Name	Genus	Species	Location
<u>Grasses</u>			
Bahiagrass	Paspalum	notatum	Pastures and lawns
Bermudagrass	Cynodon	dactylon	lawns
St. Augustine Grass	Stenotaphrum	secundatum	lawns (most common lawn grass)
Wire Grass	Aristida	stricta	native; pine flatwoods
Panic Grass	Panicum	sp.	native; on disturbed sites
<u>Ground Coverings</u>			
Periwinkle	Vinca	spp	native; disturbed sites and landscape plantings
Lily-turf	Liriope	muscari	landscape plantings
<u>Flowers</u>			
Chrysanthemum	Chrysanthemum	indicum	landscape plantings
Begonia	Begonia	sp	landscape plantings & hanging baskets
Geranium	Pelargonium	sp	landscape plantings
Marigold	Tagetes	spp	landscape plantings
Phlox	Phlox	drummondii	native; along roads and railroad tracks
Rose	Rosa	spp	landscape plantings
<u>Bulbs</u>			
Day-lily	Hemerocallis	sp	landscape plantings
Canna lily	Canna	sp	landscape plantings
<u>Ferns</u>			
Asparagus Fern	Asparagus	sp	hanging baskets and window pots
<u>Succulents</u>			
Spanish Bayonet	Yucca	aloifolia	native; landscape plantings and along roadways
Century Plant	Agave	americana	landscape plantings

TABLE 7-4 (Continued)

Common Name	Genus	Species	Location
<u>Palms</u>			
Cabbage palm	Sabal	palmetto	native; prairies and landscape plantings (state tree)
Areca palm	Chrysalidocarpus	lutescens	landscape plantings
Canary Island date palm	Phoenix	canariensis	landscape plantings
Coconut palm	Cocos	nucifera	landscape plantings
Manila palm	Veitchia	merrillii	landscape plantings
Queen palm	Arecastrum	romanzoffianum	landscape plantings
<u>Native Trees</u>			
Slash Pine	Pinus	elliottii	pine flatwoods, swamps, & left on developed land
Longleaf Pine	Pinus	palustris	on drier sites and in landscapes
Live Oak	Quercus	virginiana	better, dry soils and landscapes
Water Oak	Quercus	nigra	poorly drained sites
Red Cedar	Juniperus	silicicola	soils underlain by calcareous material and landscapes
Sweet Gum	Liquidambar	styraciflua	poorly drained sands and loams
Sweet Bay	Magnolia	virginiana	poorly drained acid sands
Turkey Oak	Quercus	laevis	excessively drained sands
Bluejack Oak	Quercus	incana	excessively drained sands
Bald cypress	Taxodium	distichium	riverine swamps
Pond cypress	Taxodium	ascendens	cypress domes and depressed lands among pine flatwoods along ditches and streams
Black mangrove	Avicennia	nitida	tidal swamps
Red mangrove	Rhizophora	mangle	tidal swamps seaward of black mangrove
Hickory	Carya	sp	mesic forests

TABLE 7-4 (Continued)

Common Name	Genus	Species	Location
<u>Native Shrubs</u>			
Saw palmetto	Serenoa	sp	pine flatwoods and deep sands
Yaupon holly	Ilex	vomitoria	deep sands and landscapes
Gallberry	Ilex	coriacea	pine flatwoods
Wax myrtle	Myrica	cerifera	pine flatwoods
<u>Exotic Species</u>			
Australian Pine	Casuarina	spp	along roads and property lines
Citrus	Citrus	spp	oranges, grapefruits, limes, lemons, and tangerines in backyards or small groves
Jerusalem thorn	Parkinsonia	aculeata	disturbed open land and landscapes
Norfolk Island pine	Araucaria	excelsa	landscape plantings
Cajeput	Melaleuca	leucadendra	disturbed open land
Rubber tree	Ficus	sp.	landscape plantings
Banana	Musa	spp	landscape plantings
Bamboo	Bambusa	sp.	landscape plantings
Sago palm	Cycas	revoluta	landscape plantings
Pampas grass	Cortaderia	sellonna	landscape plantings
Copper leaf	Acalypha	wilkesiana	landscape plantings
Croton	Cordiaeum	variegatum	landscape plantings
Hibiscus	Hibiscus	spp.	landscape plantings
Oleander	Nerium	oleander	landscape plantings
Surinam cherry	Eugenia	uniflora	landscape plantings
Brazilian pepper			grows in dense thickets on disturbed open land.

POTENTIAL IMPACTS OF AIR EMISSIONS

I. TOTAL SUSPENDED PARTICULATE MATTER (TSP) -- GENERAL EFFECTS

A. Atmospheric Effects

Once the project becomes operational, the ambient air concentration of TSP within 1 km of the emission source should increase. Visibility in the immediate vicinity will be reduced due to light scattering by the particles. Since TSP acts as a condensation nuclei for many aerosols, increased light absorption can also be expected. Coupled with reduced visibility is a decrease in the intensity of light reaching the ground. Downwind of the emission some increase in precipitation can be anticipated due to the presence of weather active nuclei for condensation. The chemical character of rain can possibly be influenced by TSP if sulfur and nitrogen oxides and other gases are absorbed by the TSP and, eventually, are precipitated.

B. Effects on Humans and Other Animals

TSP effects individuals primarily through respiration. It is known that chronic exposure to high levels of TSP may contribute to bronchitis, sinusitis, asthma, and certain other pulmonary diseases.

Connection of TSP with cardiac diseases has also been proposed. Decreased visibility and other aesthetic effects of TSP may incur some acute psychological consequences.

C. Effects on Materials

TSP can act as condensation nuclei for absorbed or adsorbed gases like sulfur dioxide, hydrogen sulfide, and nitrogen dioxide. The net effect of this and other synergistic reactions in the atmosphere will be an increase in corrosion of many metal surfaces. This is especially critical regarding

certain non-ferrous alloys (such as used in electrical relay switches) and steel and zinc. Dust collection on electrical contacts can interfere or disrupt transmission. TSP can discolor building surfaces, especially those of concrete. TSP forms a film of soot on the surface; acids adsorbed or absorbed on the TSP can cause chemical destruction of the building material. On painted surfaces the obvious visual effect of TSP is also noted. Water soluble chlorides and sulfates which frequently accompany the particle are potential sources of osmotic blistering of painted surfaces.

TSP falling on wet paints and finishes can cause visual imperfections as well as accelerated corrosion of protected material. Clothing and other textile materials are easily soiled by TSP; frequent washing to remove soils reduces material life. Cellulose materials, such as linen, cotton, and rayon are very sensitive to acidic constituents with the TSP.

D. Effects on Vegetation

Studies of airborne dust on vegetation have been limited to cement--kiln emissions. Dust settling on leaves tends to form crusts which inhibits plant growth; calcium hydroxide associated with the encrustations can cause leaf tissue destruction. Soot can clog leaf stomata and can induce necrotic spotting especially if acidic substances accompany the TSP.

Condensation of nitrogen and sulfur acids on TSP can greatly alter the chemical nature of rain (e.g. acid rain).

The light scattering and adsorptive effect of TSP reduces the intensity of sunlight reaching leaf chloroplasts. Under severe conditions, airborne TSP may interfere with the soil--atmosphere water budget altering plant zone climate.

Fluorosis and arsenic poisoning have been reported where livestock have eaten plants covered with fluoride--containing TSP and arsenic--containing TSP.

II. TOTAL SUSPENDED PARTICULATE MATTER--(TSP) POTENTIAL IMPACTS IN THE STUDY AREA

The role of airborne particles as condensation nuclei for various oxides of sulfur and nitrogen is of particular significance. Ambient sulfur oxide concentrations are elevated due to numerous industrial and utility emissions. Furthermore, nitrogen oxides will increase as waste trucks resume deliveries to the project and the east-west expressway is completed.

Soils in the study area are generally acidic and vegetated by adapted plants. Chronic changes in the rain chemistry can effect plant growth and community structure. When the incinerator was operating heavy loads of TSP were discharged into an ambient atmosphere already high in sulfur oxide. Though the terrain and its hydrologic features have been greatly altered, dense hammocks (two-to-seven acres in size) yield specimens of sabal palm, willow, wax myrtle; however an introduced species, the Brazilian peper, clearly dominates. This prolific tree has invaded most man-altered landscapes in South Florida and displaces native ecosystems. Whether the dominance of the so-called Florida holly tree is due to local air and light conditions or to the artifical creation of the substrate cannot be determined.

Start-up and operating conditions for the facility include minimum requirements for TSP emissions which are drastically reduced from former levels. This and the current chemical nature of the local atmosphere mitigate the above mentioned impacts in the study area and should limit chronic effects to the immediate plant vicinity (4 km). Some impacts (visibility reduction, material soiling, etc.) could be imparted to the residential areas beginning 1 wk west of the plant and 2 wk east of McKay Bay. TSP induced damage to vegetation or adverse effects on human and other animal health due to the operation of this facility are judged to be highly unlikely.

TSP effects on adjacent mangrove lands and estuarine waters has not been adequately studied. Upon cursory observation it is evident that damage to the community has not occurred from past conditions although the mangrove shrubs now bear the scars of a severe winter kill.

Acidic substances associated with the TSP tend to reduce rain pH which speeds the dissolution of calcareous rock; along the eastern shore of Tampa Bay but at distances from the stack greater than 3 km. This distance factor greatly minimizes any chemical impact on study area agricultural lands, which lie from 4 to 7 km east of the emission point.

III. EFFECTS OF NITROGEN OXIDES -- GENERAL

A. Effects On The Atmosphere

Nitrogen oxides are most common in the air as nitric oxide and nitrogen dioxide. Nitrogen dioxide absorbs light energy over the entire visible spectrum which can greatly reduce visibility and light intensity. Nitrogen oxides in complex interactions with hydrocarbons, is an important factor in smog formation; morning hour ambient Nitrogen oxides concentrations have been directly correlated with photochemical oxidant levels later in the day. The chemical character of rain and TSP can be altered by the action of gaseous and/or liquid Nitrogen oxides, as discussed previously.

B. Effects On Humans And Other Animals

Nitric oxide has little harmful effect on humans; however, when oxidized to Nitrogen Dioxide, adverse conditions form. Symptoms range from increased airway resistance to formation of emphysema--type lesions in the lungs. Mice exposed to high Nitrogen dioxide concentration were more susceptible to pulmonary infections (e.g. bacterial pneumonia, influenza).

There is evidence that excessive Nitrogen Dioxide can contribute to cellular changes in the heart, liver, and kidney, prompted by imbalances in blood gases. Human exposure to very high Nitrogen Dioxide concentrations for five minutes has produced death. Methemoglobin levels in the blood of children are usually high where ambient Nitrogen Oxides concentrations are also high.

Smog, a direct product of excessive Nitrogen Oxides, produces physiological and psychological aberrations in humans and animals.

Secondary effects on human health, center on the strong odor produced by Nitrogen Dioxide and the aesthetic impacts of visibility reduction.

C. Effects On Materials

High Nitrogen Dioxide concentrations can accelerate the fading of sensitive dyes used in cellulose acetate fibers. Cotton and nylon textile fibers can be physically damaged in environments high in Nitrogen Oxides. Excessive particulate nitrate in the atmosphere has been cited as causing stress corrosion of nickel-brass spring relays used in electrical transmission.

D. Effects On Vegetation

Laboratory studies illustrate that excessive Nitrogen Dioxide concentration causes necrotic spotting of leaves. Continuous fumigation of navel orange trees with high levels of Nitrogen Dioxide caused leaf abscission and chlorosis.

There is some evidence that plants may be more sensitive to high Nitrogen Oxides in the air during the day than at night. The extent to which Nitrogen Oxides affects photosynthesis is largely unknown, although reduced growth is probable. The role of Nitrogen Oxides in smog formation indirectly impacts vegetation by reducing light intensity.

IV. NITROGEN OXIDES--POTENTIAL IMPACTS ON THE STUDY AREA

The combustion of solid wastes releases considerable amounts of Nitrogen Oxides to the atmosphere; by far the largest emitters are automobiles and fossil fuel-fired power plants (especially those using natural gas or coal). With the exception of the Hookers Point Power Plant (which uses fuel oil), all TECO units in or near the study area now or soon will be burning coal. Ambient

Nitrogen Oxides in the atmosphere will further increase as traffic into and around the facility and the burning of solid waste resumes.

High concentrations of Nitrogen Oxides in the study area atmosphere can result in chemical changes in rain, visibility reduction, smog formation, and necrotic disease in vegetation.

Formation of acids of nitrogen and their impact on water are similar to those previously discussed in the section on TSP. Of particular significance in Tampa's humid climate is stress corrosion of electrical hardware by atmospheric nitrates.

It is difficult to assess trade offs in Nitrogen Oxides concentration once the new east-west expressway is completed. By improving traffic flow, vehicular Nitrogen Oxides emissions should decrease, but by providing better access, local traffic may increase. Nevertheless, refuse trucks and the cars of plant employees and visitors will again come to the facility on a daily basis which will increase Nitrogen Oxides concentration in the air. However, trucks and cars powered by diesel engines emit far less Nitrogen Oxides than do conventional gasoline driven vehicles.

The reaction of nitrogen oxides with atmospheric oxygen produces ozone contributes to smog formation. Smog has and continues to be a frequent problem in Tampa. Startup and operation of this plant will aggravate the local situation to some degree although its relative contribution of Nitrogen Oxides to the ambient atmosphere will be low.

Damage to vegetation caused by this project would be limited to plants immediately surrounding the site. Chlorosis or leaf abscission have not been studied in the adjacent emergent communities. As previously mentioned, it is difficult to evaluate the successional stage this stressed ecosystem has reached (e.g. pioneer, climax). It appears that native vegetation exists by virtue of its height, suggesting that the brazilian pepper is taking over. It can be speculated that this ubiquitous species is better adapted to local air quality and perhaps more resistant to the effects of Nitrogen Oxides; (and other air pollutants) than certain native vegetation.

Conversion of atmospheric Sulfur Dioxide to sulfur trioxide is increased in the presence of monovalent oxygen, as is liberated by Nitrogen Dioxide when exposed to sunlight. Sulfur Trioxide is transformed into sulfuric acid by reactions with moisture. Excessive Nitrogen Oxides coupled with ambient Sulfur Dioxide can yield an acidified rain capable of corroding surfaces and irritating human respiratory organs.

V. EFFECTS OF SULFUR OXIDES --GENERAL

A. Effects On The Atmosphere

Sulfur Oxides is a by-product of fossil fuel combustion, kraft pulp and paper processes, and sulfur recovery plants. In the atmosphere, it is most commonly found as sulfur dioxide, but also as sulfur trioxide and sulfurous or sulfuric acid. Sulfur acid mists and gaseous Sulfur Oxides absorb sunlight and form complexes with TSP which increases light scattering. The influence of Sulfur Oxides complexed with TSP on rain chemistry has already been discussed.

B. Effects On Humans And Other Animals

Pathological lung change or mortality in animals required high concentrations of Sulfur Dioxide or Sulfuric Acid.

The most common malady of humans caused by high Sulfur Oxides is increased airway resistance due to bronchoconstriction. Since Sulfur Dioxide is quite soluble, it is absorbed rapidly in the upper portions of the respiratory tract; deepened breathing in contaminated atmospheres (such as when exercising) facilitates the penetration of Sulfur Dioxide into the alveoli of the lung.

Sulfuric acid is much more of an irritant than is Sulfur Dioxide; its effects on humans and animals are highly dependent on particle size. Like Sulfur Dioxide, it increases airway flow resistance and may have additional corrosive effects on tissue.

C. Effects On Materials

Atmospheres polluted with Sulfur Oxides are often more corrosive than marine environments; stress failures of electrical equipment and increased resistance of contacts (due to coating of corrosion products) are principal consequences.

Sulfurous and sulfuric acids attack carbonate--containing stone (e.g. limestone, marble, mortar) and convert the carbonate to readily soluble sulfates.

Sulfur acids also reduce the strength of certain plants (cotton, hemp) and synthetic fibers. Both paper and leather absorb Sulfur Dioxide which causes strength loss, brittleness, and some discoloration.

D. Effects On Vegetation

Adverse impacts stem from a plant's ability to transform absorbed Sulfur Dioxide into Surfuric Acid and then to sulfates which are deposited in the leaf. Visible symptoms of sulfates storage stress include acute legions, chronic chlorosis, and excessive leaf abscission.

The acid effect of Sulfur Oxides (i.e. sulfurous, sulfuric acid) does promote chlorophyll degradation in lichens and mosses; toxicity is greater at higher humidity and lower pH. The ability of the plants to metabolize Sulfur Dioxide to sulfates correlates with their resistance to toxicity. The effect of TSP-associated Sulfur Oxides on rain chemistry, soil pH, and vegetation have been previously discussed.

Of some local interest is the utilization of Sulfur Dioxide by tomato plants in their protein metabolism.

VI. SULFUR OXIDES--POTENTIAL IMPACTS IN THE STUDY AREA

Sulfur Oxides are not in high concentrations in most refuse incinerator exhaust gases; the most significance effect of the project on ambient Sulfur Oxide levels is tied to its emission of Nitrogen Oxides and TSP. The importance of TSP as condensation nuclei for aerosols of Sulfur Oxides and the role of Nitrogen Dioxide in forming Sulfuric acid have both previously been discussed.

Damage to vegetation and buildings, and adverse effects on human health due to Sulfur Oxides discharged into the atmosphere by this facility are not anticipated, although Sulfur Oxides concentrations in the immediate study site (1 km) will vary directly with plant operation.

VII. EFFECTS OF BERYLLIUM (Be)--GENERAL

A. Effects On The Atmosphere

Beryllium is found in the atmosphere as an oxide or in a variety of soluble and insoluble compounds. These substances may be associated with TSP. Relationships between Beryllium and TSP and atmospheric interactions of Beryllium are largely unstudied.

Beryllium is a product of various metallurgical industries, is used in rocket fuels and is associated with atomic power plants. Atmospheric contamination is accomplished by the combustion of material containing Beryllium and by the suspension of Beryllium particles from surfaces. There is also speculation of a pathway between Beryllium in thermal effluents of nuclear power plants and the atmosphere.

B. Effects On Humans And Other Animals

Beryllium is one of the most hazardous and toxic of nonradioactive substances used in industry. Soluble compounds, such as beryllium sulfate and beryllium chloride produce acute pneumonitis; certain insoluble substances such as metallic beryllium and BeO produce berylliosis, a

chronic pulmonary disease. Body-wide systemic damage with respiratory, dermal renal and skeletal manifestations can also occur. Studies relating cancer mortality to Beryllium in air samples found strong connections between Beryllium and pneumonia, with possible links to cancer in males.

Physical contact with Beryllium is much less toxic; contact dermatitis consisting of a rash is common to sensitive individuals and disappears after Be handling ceases.

Other manifestations attributed to Beryllium poisoning include allergic dermatosis, chemical ulcer, and ulcerating granuloma.

C. Effects On Materials

Potential impacts of Beryllium on various materials are unstudied.

D. Effects On Vegetation

Some Beryllium in the soil is toxic to plants due both to poisoning and to nutrient depletion. In bush beans, Beryllium taken into the plant from the soil was toxic in small doses; the copper content of the plant was reduced in direct response to Beryllium uptake.

VIII. BERYLLIUM--POTENTIAL IMPACTS IN THE STUDY AREA

Beryllium could be associated with certain wastes incinerated at the site. The estimated emissions are below the deminimas values and this should not be a problem. The nature of the emitted Beryllium compounds (e.g. soluble, insoluble) will influence their dispersion. Soluble materials may form complexes with other aerosols, mists, or gases and liquids bound to TSP; insoluble compounds will precipitate with TSP.

Toxic effects, if any, would most likely appear first in vegetation surrounding the site or in facility employees.

IX. LEAD -- GENERAL

A. Effects On The Atmosphere

Lead in the atmosphere is found as lead dust or a TSP associate and originates from certain metal finishing processes and smelters, lead foundries, coal fly ash from power plants, and vehicular exhausts (where leaded gasoline is used). The most common forms of lead compounds are lead oxides and lead salts. Inorganic lead from automobile engine deposits are chlorides, bromides, and sulfates.

The association of lead with TSP may play a role in the formation of smog and/or visibility impairment. The effect of particulate lead on atmospheric processes are unknown; any role as a condensation nuclei is not reported, although lead aerosols are significant in some areas and could absorb and/or scatter light.

Residence time of lead isotopes in the atmosphere indicates that the compounds are efficiently captured by rainfall and precipitated.

B. Effects On Humans And Other Animals

Lead causes toxic reactions in humans when it is ingested and inhaled; inhalation produces more severe poisoning. Ingestion of lead is accomplished by consuming contaminated plants, animals and water. It is persistent in the environment and is accumulated in food chains. The most serious (and common) malady of lead is lead poisoning; symptoms range from body pains and dermatography to encephalopathy; victims of lead intoxication exhibit sluggish behavior and other traits often resulting in inaccurate diagnosis. Mutagenic and carcinogenic implications of lead are not well studied.

There are many instances of lead poisoning of livestock which have consumed vegetation contaminated with precipitated lead.

C. Effects On Materials

Research on the direct impact of atmospheric lead compounds on materials is not available. The abilities of physical surfaces to absorb, adsorb, or evict lead particulates is of significance to immediate ambient lead concentrations.

D. Effects On Vegetation

Metal dusts of lead carbonate, lead oxide and lead sulfate have little or no direct or indirect harmful effect on plants. The most significant relationship between vegetation and lead is the potential for consumption of contaminated plant material by livestock and the resultant effect on food chain species.

X. LEAD--POTENTIAL IMPACTS IN THE STUDY AREA

Emissions of lead from the proposed facility would arise from the combustion of lead materials in batteries, paints, certain metal alloys, and street dusts. Due to the rapid settling and rain washout characteristics of these emissions direct impacts would be limited to the area immediately surrounding the facility. It is not possible to project any human impacts although lead concentrations of soils onsite and in surrounding estuarine waters may rise, stimulating concern of bioaccumulation.

Resumption of traffic to the facility will increase lead accumulation onsite roadways and on adjacent vegetation.

XI. MERCURY -- GENERAL EFFECTS

A. Effects On The Atmosphere

Atmospheric mercury is derived from:

1. natural process, including the erosion of mercury--containing soils and rocks and other hypogene and supergene processes and,

2. from the combustion of certain fossil fuels and other materials, including some agricultural chemicals (fungicides), paints lubricants, and batteries. Mercury is liberated to the atmosphere through evaporation and has many forms, notably as Hg vapor, inorganic compounds (e.g. $HgCl_2$), and organomercurials (ethylmercury chloride).

Ambient mercury concentrations in the air vary seasonally with temperature and daily with barometric pressure. At least one study has related the occurrence of smog with high atmospheric mercury.

Mobility of mercury is enhanced by its characteristic high vapor pressure in the metallic state. Increases in temperature increases the saturation level of mercury in air in equilibrium with metallic mercury. Rainfall conveys a large part of airborne mercury to surrounding waters and soils; Mercury is strongly absorbed by soils and sediments.

B. Effects On Humans And Other Animals

Organomercurials are more readily absorbed by animals and are more difficult to excrete. Certain inhaled inorganic mercury phenyl compounds leave the blood in a few hours and are promptly excreted; alkylmercurials, however, are highly toxic. In humans, mercury has been shown to affect spindle formation in chromosomes producing aberrant divisions; breakage of chromosomes is also reported.

Mercury poisoning, or mercurialism, is most frequently contracted by inhalation of mercury vapors. Symptoms of mercurialism observed in laboratory animals are an increase in catalase activities of blood erythrocytes, anemia, increased salivation and apathy. In humans mercury inhibits certain enzymes, promotes potassium ion loss, blocks glucose uptake by erythrocytes and muscles, causes lesions of the central nervous system and alters transmembrane potentials thereby blocking nerve conduction. Chronic manifestations of Hg poisoning are gingivitis and stomatitis, and tremor and erethism. Death usually results from acute exposure.

The hazard posed by mercury in the environment came to light in the last few decades in Minamata and Nigata, Japan, where fatalities and teratogenic effects of local people were attributed to their consumption of mercury--contaminated fish.

C. Effects On Materials

Data concerning the impact of mercury on materials are not available.

D. Effects On Vegetation

Generally, mercury can cause chlorosis, leaf abscission and slowed growth in plants. In experiments with bean and mint plants, exposure to mercury vapor caused leaves to turn completely black within 3 days. Coatings of sulfur or water on plant leaves inhibited this effect of mercury. It was further shown that mercury is not harmful to plants unless it is mixed with soil or water. Mercury oxide in the soil caused feebleness and disfiguration of bean plants while direct contact of mercury with mint plant roots was fatal.

Mercuric chloride and organic mercury fungicides are reduced in the soil forming metallic mercury which can injure plants.

XII. MERCURY--POTENTIAL IMPACTS IN THE STUDY AREA

The volatile nature of mercury makes impact analysis difficult. Mercury emissions from the facility will result from the combustion of batteries, vegetative materials (including textiles and paper) containing mercury based fungicides, certain plated metals, and mercury-laden dust and dirt. The atmospheric residence time and dispersion area for mercury is probably small; thus most of this pollutant will remain at or very near the site. Therefore, some increase in soil levels of mercury immediately surrounding the stack is anticipated. Washoff of mercury compounds with runoff into adjacent waters is inevitable where they can enter the food chain.

The toxicity of most plants to mercury should be utilized to monitor the extent of mercury pollution to the study site (e.g. conduct routine examinations of vegetation for mercury disease manifestations (such as leaf blackening).

Alternative

The continued and expanded use of coal by most study area power plants will further increase ambient mercury concentration; the potential for toxic effects on humans, animals, and plants will likewise increase.

Whether sulfur compounds in dusts covering vegetation at the study site interfere with the destruction of leaf tissue by mercury is worthy of further study.

XIII. FLUORIDE--GENERAL EFFECTS

A. Atmospheric Effects

Fluorides are found in the atmosphere as gases, such as hydrogen fluoride (HF) and silicon tetrafluorides (SiF_4), or a particulate substances, such as cryolite, fluorapatite, calcium fluoride and aluminum fluoride. Both gaseous and particulate Fluoride compounds, like NO_x and SO_x interact with aerosols and dust in the atmosphere which further ramifies the potential impacts of particulate matter. Natural sources of Fluoride include the dissolution of both igneous and sedimentary rocks. Of particular interest is the location of extensive deposits of phosphate (chiefly fluorapatite) in the eastern portion of the study area, centering near Bartow. In addition, many Fluoride compounds are contributed to the atmosphere through vulcanism.

Fluoride is contributed to the atmosphere primarily by man-made (industrial) sources. The manufacture of phosphate fertilizers and wet-process phosphoric acid releases Fluoride compounds during the crushing and drying of phosphate rock (fluorapatite dust) other Fluorides are generated by the manufacture of normal superphosphate fertilizer (hydrofluoric acid and SiF_4), the production of wet-process phosphoric

acid, and in producing 4 triple superphosphate fertilizer from phosphoric acid. Waste liquors from wet-process phosphoric acid are generally stored in settling ponds; as concentrations of hydrofluoric acid and fluorosilicic acids increase in the pond, volatile fluorides vaporize into the atmosphere. Fluoride emissions are also produced (to a lesser degree) by the manufacture of diammonium phosphate fertilizer.

Fluorides are also produced by the manufacture of elemental phosphate; SiF_4 may leak into the atmosphere around seals in older-design boilers. Since most fluorine must be removed from fluorapatite in the preparation of animal feed supplements, emissions of HF and dust result.

In the manufacture of Portland cement, mixtures of clay and limestone are gradually heated in rotary kilns to form clinker which is then ground to a fine powder. Fluoride in the clay reacts with lime during firing forming Calcium Fluoride. Resulting Fluoride dusts from the operation (if uncontrolled) can escape into the atmosphere. Dusts from "white cement" manufacturing is much higher in Fluoride due to the utilization of cryolite and Fluorspar as fluxing agents.

Most coal contains some Fluoride, usually as Fluorapatite or Fluorspar. During combustion (as in a power plant) approximately half of the Fluoride is evolved as HF, SiF_4 or in association with particulate matter

The most significant sources of atmospheric F result from the manufacture of aluminum and steel. Emissions from aluminum electrolysis cells include gaseous HF and SiF_4 compounds; particulate Fluoride compounds are primarily calcium fluoride, aluminum fluoride, and chiolite. Calcium fluoride and HF are the primary constituents in emission from most steel manufacturing process.

Fluorides are also a potential air contaminant in the manufacture of brick, tile and pottery (HF and SiF_4); in the manufacture of glass, enamel, and fiber glass mats and fibers (HF and calcium fluoride); in the generation of commercial fluorides (HF and SiF_4); in petroleum refining; in metal casting, welding, and brazing (calcium fluoride; and in certain electroplating processes).

A wide variety of fluorides are also used as biocides, including sodium fluoride, sodium fluorosilicate, barium, fluorosilicate, fluoroacetic acid, and those compounds sold under trade names of Balan, Benefin, and Cotoran. Utilization of the chemicals as sprays or dust can release Fluoride into the atmosphere; of significance to this study are the potential emissions through combustion of residual biocides by the proposed facility.

B. Effects On Humans And Other Animals

In humans, gaseous fluorine and HF are absorbed from the respiratory tract and through the skin; ingested soluble fluorides are absorbed through the gastrointestinal tract. Severe effects on airborne fluoride on man includes crippling fluorosis and osteosclerosis; most fluorine-associated maladies to man however are associated with ingestion of nonairborne species (e.g. mottling of teeth enamel) is facilitated when forage vegetation is contaminated by airborne compounds and is eaten by livestock. A number of specific conditions can result including abnormalities in teeth, osseous lesions, lameness and appetite impairment (which may decrease weight gain and/or diminish milk yield). Evidence suggests that dairy cattle are the most sensitive domestic animals to fluoride ingestion; feeder cattle have been shown to be more tolerant of higher levels of Fluorides.

C. Effects On Materials

Evidence of harmful effects on such materials as metals, textiles, wood, and plastics is not presented in the literature; of importance to man though are the effects of fluorine on tooth enamel (both harmful and beneficial).

D. Effects On Vegetation

Like heavy metals, fluorides persist in vegetable tissue and accumulate with both acute and chronic exposure. Most damage to plants is caused by HF although SiF_4 has also been identified as a damaging agent.

Fluorides penetrate the plant leaf through stomata and dissolve in the aqueous solution which bathes the leaf tissue. In solution, they travel with the transpiration stream and accumulate at the leaf periphery (especially at lower ambient concentrations of Fluoride). Damage to tissue takes several forms. At higher atmospheric concentrations, absorbed Fluoride causes acid-type burns in sensitive tissue allowing cell contents to spill into intercellular spaces and the infected leaf usually turns brown. Acute injury to plants extends the necrotic injury from the tips to the bases of leaves; a dark colored band usually separates the living from dead tissue and with repeated exposures to acute contamination a series of bands can result.

Certain pines are susceptible to necrotic damage to needles (primarily needles less than 1 year old); evidence of injury is indicated by a reddish-brown color.

'Acute non-lethal' doses of Fluorides (i.e. intoxication) on many dicotyledons causes the collapse of the spongy mesophyll and lower epidermis followed by damage to the chloroplasts of the palisade cells; evidence of injury consists of leaf browning (more prevalent in hot, dry weather).

Of interest in monitoring atmospheric fluorides is that necrotic damage to plants is abrupt and the transition from healthy tissue to lesions is rapid.

Fluorides may also inhibit enzymes (such as enolase) by forming a complex block on an active catalytic site. In certain cases metabolic adjustments by plants to meet such conditions result in the plant's increased susceptibility to nutrient stress.

In evaluating impacts of air pollutants on vegetation (as well as man and other animals) synergistic effects between the various pollutants assume special significance. For example, some plants are tolerant of high levels of SO_x and Fluorides; some are sensitive to one pollutant, but tolerant of others. In atmospheres contaminated by a variety of chemical compounds the plant's ability to maintain and evolve a viable, resistant gene pool is the key limiting factor in its adaptation to the stress.

XIV. FLUORIDES--POTENTIAL IMPACTS ON THE STUDY AREA

The concentration of many phosphate, portland cement, and coal-fired electrical generation facilities in the study area points out the importance of particulate and gaseous fluoride generation; the amount actually emitted to the atmosphere is questionable although the sheer magnitude of production poses a strong potential for contamination.

Combustion of solid waste, especially when fluoride compounds are involved (e.g. pesticides, certain metals, certain fibers), will produce gaseous and particulate Fluorides compounds by the use of scrubbers and/or cyclones. Damage to vegetation in the area of impact induced by fluorides will be difficult to assess due to forementioned synergistic effects and the specific responses by affected vegetation.

As no dairy farms are within close proximity of the emission site, untoward impacts on such operations are not anticipated.

Potable water supplies for local residents come mainly from north of the study area and well out of the zones of fluorapatite phosphate rocks. However, some surface waters entering Hillsborough Bay do have their headwaters in that region (e.g. Alafia River) concentrations of fluoride in the water are presumably elevated. Adverse impacts on humans and other animals from such ambient levels in adjacent surface waters are not reported.

VISIBILITY AND CLASS I AREA ANALYSIS

The Clean Air Act Amendments of 1977 require evaluation of new and existing emissions sources to determine potential impacts on visibility in Class I areas. These source evaluations are to be used as part of a regulatory program to prevent future and remedy existing impairment of visibility in mandatory Class I Federal areas that results from man-made air pollution.

The visibility analysis is taken from EPA "Workbook for Estimating Visibility Impairment" November, 1980 which provides the general guidance for determining the potential impacts of an emissions source on Class I visibility.

There are two separate classes of visibility impairment: atmospheric discoloration and visual range reduction (increased haze) see Figure 7-1. EPA has defined "visibility impairment" to mean any humanly perceptible change in visibility (visual range, contrast, coloration) from that which would have existed under natural conditions. An important part of a visibility analysis is to determine the frequency of occurrence and magnitude of visual impact in or within view of a Class I area. Figure 7-2 shows a schematic of visibility screening analysis procedure. A Level I analysis was performed (Appendix H) which the input data included NO₂, SO₂ and the particulate emissions for the McKay Bay Project. Regional visual range and distance to the nearest Class I area was used. This area was identified as the Chassahowitzka National Wildlife Refuge located northwest of Brooksville, Florida. A plume contrast rating load was established with reference to the sky, the terrain and the primary and secondary aerosol. EPA has established a rating factor for the Plume Contrasts which provides guidance for determination of further analysis. The absolute values of each plume contrast rating was calculated to be 0.001 which is less than the EPA factor of 0.10. Therefore, further analysis of potential visibility impacts are unnecessary as it is considered highly unlikely that the Project would cause adverse visibility impairment in Class I areas.

Figure 10. Two types of plume visibility impairment considered in the level-1 visibility screening analysis.

Geometry of plume, observer, and line of sight used in level-1 visibility screening analysis.

SOURCE: EPA Workbook For Estimating Visibility Impairment

FIGURE 7-1

Schematic of visibility screening analysis procedure. The numerical meaning of the terms "significant" and "adverse" differ on a case-by-case basis and will be defined after an in-depth policy analysis of each case.

FIGURE 7-2

Other Factors

Fugitive Dust

The most significant air emission anticipated during construction is fugitive dust generated by numerous vehicles from the transportation of the workforce. Additionally anywhere from 5-12 pieces of construction equipment will be used in excavating, scrapping, filling and compacting. Fugitive dust can be reduced by the frequent spraying of water on the site and roadway. For the operational phase fugitive dust emissions are caused primarily by the frequent delivery of solid waste to the facility. With proper surface treatment these emissions are minimized.

Noise

Noise generation is another characteristic of construction activity. This potential nuisance will be generally limited to normal working hours thus allowing a reduction of noise during the evening hours. The primary source of noise during the operational phase is the movement of the solid waste delivery vehicles. Again the times available will be restricted allowing a break in the noise level thus reducing the nuisance potential.

Dust

Dust and odors in the refuse handling area will be trapped by enclosure of the tipping area. This area will also be placed under negative pressure with the air then being used as the combustion air. The high temperatures then remove any potential for emission of odor.

Explosions And/Or Fires

Explosions or fires within the pit areas are minimized by training the crane operators who manage the pit area. Any smoldering material will be loaded immediately into a combustion unit thus resolving the problem. Also, firehoses and sprinklers will be available. If explosive material were accidentally fed into

a combustion unit, any resulting explosion would be dissipated within the large volume of the boiler.

Vermin And Rodent Control

Vermin and rodent control is accomplished by the enclosure of the pit area. The refuse is managed within the pit by the crane operator who minimizes any concentrations of food supplies. The refuse in the pit will be stored no more than three days before being combusted. This will eliminate vermin and rodent survivability.

Dioxins

One emission of potential concern is the pollutant "dioxin". Dr. E. Joseph Duckett, Director of Research, Schwartz & Connolly, Inc. prepared an article on dioxins. Excerpts from this article are quoted as follows:

"The recently reported detection of one type of organic pollutant, "dioxins," in the stack emissions of the Hempstead, N.Y., resource recovery facility has aroused a considerable amount of controversy, confusion and understandable concern within the resource recovery community. There are major gaps in our fundamental understanding of the sources and effects of dioxins. The existence of these gaps tends to create an atmosphere of confusion around the topic of dioxin emissions from refuse combustion facilities. One element of confusion results from the use of the term "dioxin". Dioxin is not a single chemical compound, rather dioxins are a family of organic compounds. From an environmental health point of view, the types of dioxins attracting the most interest are the polychlorinated dibenzo-p-dioxins, especially the tetrachlorinated dibenzo-p-dioxins (TCDD's). There are 22 isomers (i.e., different formulations) of TCDD's and among these the most studied is the so-called "2, 3, 7, 8" isomer. Not all 22 TCDD isomers have been tested for toxicity, but among those tested, the 2, 3, 7, 8 TCDD isomer is the most toxic and is

reportedly 3 to 100 times more toxic than other TCDD isomers.

Related to the confusion over the term "dioxins" is the fact that when it is reported that dioxins are emitted from a combustion facility, this does not necessarily indicate the presence of specific groups of dioxins such as the TCDD's nor specific compounds such as the 2, 3, 7, 8 TCDD isomer. At Hempstead, it was reported that TCDD's were present in stack emissions but the presence of the 2, 3, 7, 8 TCDD isomer has not been confirmed. The Hempstead experience was not the first report of TCDD's in stack emission from waste-fired furnaces. There have been European and Japanese reports of TCDD (as well as other types of dioxins) detection in fly ash from municipal and industrial incinerators. There is also at least one U. S. study (conducted by the Dow Chemical Co.) in which TCDD's were reportedly found in particulate samples from the Nashville waste-to-energy facility. With the exception of the Dow results, all of the incinerator studies to date (including the Hempstead sampling results) have reported detection of TCDD's as a class but none have confirmed the presence of the specific 2, 3, 7, 8 TCDD isomer. The Dow study reported that the 2, 3, 7, 8 isomer was present in a concentration of 400 parts per trillion in one sample (i.e., the only sample analyzed) of fly ash from the Nashville facility.

Still another element of confusion is that the relative importance of waste-fired furnaces vs. other types of activities as sources of TCDD emissions is completely unknown.

Even if the concentrations of TCDD's and of the 2, 3, 7, 8 TCDD isomer in stack emissions were known precisely, there would still be uncertainty about what human exposures could result from emission concentrations.

Despite the fact that the 2, 3, 7, 8 TCDD isomer is acknowledged to be a toxic compound, there are not health effects standards against which to judge the significance of any ambient concentration or human exposure."

Solid waste report, May 20, 1981. A Bi-weekly Business newsletter states that an American Society of Mechanical Engineers (ASME) Report finds minimal risk of cancer from refuse incinerator dioxin emissions. The newsletter article is quoted as follows:

"The risk of cancer posed by the potential of dioxin emissions from refuse-to-energy incinerator" is several orders of magnitude less than the risk of death to which the general public is exposed" both voluntarily and involuntarily in everyday life, a study issued by the American Society of Mechanical Engineers concludes. Released late last month, report emphasizes that furthe study is needed "to better define the problem and to determine the potential cost-effective methods of further reducing possible risks to the practicable minimum."

Waste-to-energy plants should continue to operate, report says, while plans to control potential dioxin emissions are developed further. Reasons given for continued operation include: 1) current level of risk represents a worst case scenario, and in practice the actual risk should be less; 2) overall health risks from other methods of solid waste disposal, such as landfilling, 'are probably at least as great as indicated... for potential discharges of dioxins from combustion of solid waste'; 3) benefits from utilization of the energy from combustion of solid waste in conserving conventional fuels resources are substantial; and 4) solid waste generated by the public 'must be disposed of with minimum overall risk to the public'."

On June 18, 1981 the following article appeared:

EPA DIOXIN POLICY COMING

What the Environmental Protection Agency has come to call the nonissue of dioxin - as it relates to resource recovery plants and other combustion processes - is likely to be laid to rest soon by a policy statement from headquarters, according to an EPA official.

"Within a month or two we'll issue a statement that, in essence, will say the whole thing was a joke," says the official. "It's not the problem we thought it was."

EPA's pursuit of the dioxin issue began with the discovery of trace concentrations in Agent Orange, a defoliant used in the Vietnam war, and later, as a result of an explosion of a herbicide plant in Seveso, Italy, that contaminated surrounding areas with dioxin.

The agency's search led to the discovery of 3 to 9 parts per trillion of dioxin in the stack gas from a \$120-million resource recovery plant in Hempstead, N.Y., which has been shut down since March, 1979 (ENR 2/19, p. 14).

Those concentrations - which extrapolate to roughly 1/10,000 parts per trillion in the air at ground level - and similar trace levels suspected at other refuse-burning plants, threw a cloud over the agency's efforts to promote resource recovery as an alternative to landfilling municipal wastes. EPA has been working to defuse the issue ever since.

A recent study by the American Society of Mechanical Engineer's research committee on industrial and municipal waste supports EPA's expected policy statement. The 180-page report concludes that risks to human health are minimal.

Concentrations of dioxin from refuse incinerators are so low, the report states, that there is an indicated risk of one additional cancer case per million persons per year. That compares with the voluntary risk of smoking 20 cigarettes per day, which results in 5,000 anticipated deaths per million, and the involuntary risk of influenza, which accounts for 20,000 deaths per million per year.

"The subject of dioxin is a product of our technological advances and measurement capabilities, but we don't really know what it means," says Charles O. Velzy, chairman of the research committee and president of Charles R. Velzy Associates, Armonk, N.Y. "We've got to get some basis for risk assessment in order to set priorities in this country," he says.

APPENDIX B:
PINELLAS COUNTY--EMISSIONS INVENTORY
FOR PERMITTED SOURCES

1981

BOARD OF COUNTY COMMISSIONERS

PINELLAS COUNTY, FLORIDA

315 COURT STREET

CLEARWATER, FLORIDA 33516

COMMISSIONERS

BRUCE TYNDALL, CHAIRMAN
CHARLES E. RAINY, VICE-CHAIRMAN
GABRIEL CAZARES
JOHN CHEBNUT, JR.
BARBARA SHEEN TODD

RECEIVED
HILLSBOROUGH COUNTY
DIVISION OF PUBLIC UTILITIES & SAFETY

May 8, 1981

MAY 11 1981

PROGRAMS AND FISCAL
MANAGEMENT

Mr. Joseph Murdock
Division of Public Utilities and Safety
Hillsborough County
P.O. Box 1110
Tampa, Florida 33601

Dear Mr. Murdock:

We are enclosing a copy of the Emissions Inventory for Permitted Sources which you requested.

If there is any other information we can provide, please don't hesitate to contact us at (813)448-2521.

Sincerely,

A handwritten signature in cursive ink that appears to read "Peter A. Hessling".

Peter A. Hessling

PINELLAS COUNTY
EMISSIONS INVENTORY FOR
PERMITTED SOURCES

1980

The 1980 Emissions Inventory contains information from 63 facilities with a total of 129 permits to operate and 2 permits to construct.

The following are grand totals for reported and calculated emissions for all permitted sources within the County during 1980:

	<u>REPORTED</u> (Tons/Year)	<u>CALCULATED</u> (Tons/Year)
PARTICULATES	1,283.32	1,956.50
SULFUR OXIDES	32,990.78	33,652.55

The calculated emissions are greater than the reported data because several sources do not report emissions while others report incomplete data.

Florida Power Corporation and Stauffer Chemical Company are by far the largest emitters of particulates and sulfur oxides in Pinellas County.

In regard to total suspended particulates,

Florida Power Corp. accounts for	57.37%
Stauffer Chemical Company accounts for	35.50%
All other permitted sources account for	7.13%

In regard to sulfur oxides emissions,

Florida Power Corp. accounts for	97.88%
Stauffer Chemical Company accounts for	2.08%
All other permitted sources account for	0.04%

By grouping the rest of the permitted sources according to their type, they contribute as follows:

- Concrete plants account for 2.67% of TSP and .02% of SO_x.
- Asphalt plants account for 2.70% of TSP.
- Boilers/Food Processing account for 0.62% of TSP.
- Incinerators account for 0.40% of TSP.
- All other sources account for 0.74% of TSP and 0.02% of SO_x.

Table 1 shows the main emitting sources (bubble concept), and their contribution in percent of total emissions.

Pinellas County Emissions Inventory
for Permitted Sources - 1980
Page -2-

As can be seen from data depicted in table 2, the information reported for the calendar year 1980 show an increase of 4.17% and 3.83% in particulates and sulfur oxides emissions respectively, when compared against 1979 data. Increases of 8% and 11% were observed for TSP and SO_x data reported in 1979 with respect to corresponding data for 1978.

Tables 3A and 3B depict the emission behavior of the two largest emitters. Florida Power had the biggest emissions during 1978; then it abated its output during 1979 and increased it again during 1980. The differences observed in the calculated data for Stauffer Chemical Company are basically due to the fact that this company has consistently reported incomplete information in their annual operations reports.

TABLE 1
MAIN EMISSION SOURCES (BUBBLE CONCEPT)

<u>SOURCE</u>	<u>PARTICULATES (TONS/YEAR)</u>	<u>% OF TOTAL EMISSION</u>	<u>SO_X (TONS/YEAR)</u>	<u>% OF TOTAL EMISSION</u>
Florida Power Corp. Bartow Plant	843.99	43.1	25,223.97	74.95
Florida Power Corp. Higgins Plant	252.57	12.91	7,517.55	22.33
Stauffer Chemical Company	695.55	35.5	700.31	2.08
Florida Power Corp. Bayboro Plant	26.93	1.37	203.61	0.60

APPENDIX D:
DATA ON INCREMENT CONSUMING INSTALLATION

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION IV

DEC 24 1980

345 COURTLAND STREET
ATLANTA, GEORGIA 30308

REF: 4AH-AF

The Honorable Bob Martinez
Mayor, City of Tampa
306 E. Jackson
Tampa, Florida 33602

RE: Tampa Electric Company
Power Generating Facility Modification
PSD-FL-040.

Dear Mayor Martinez:

I wish to bring to your attention that the Tampa Electric Company proposes to modify their power generating facility near the city of Tampa, Florida, and that emissions of air pollutants will thereby be increased. The U.S. Environmental Protection Agency (EPA) has reviewed the proposed modification under the authority of Federal Prevention of Significant Deterioration Regulations (40 CFR 52.21) and reached a preliminary determination of approval with conditions for this construction. This approval applies only to Federal regulatory requirements and has no bearing on State or local functions.

Please also be aware that the attached public notice announcing the Agency's preliminary determination, the availability of pertinent information for public scrutiny, and the opportunity for public comment will be published in a local newspaper, Tampa Tribune, in the near future. This notice has been mailed to you for your information and in accordance with regulatory requirements. You need take no action unless you wish to comment on the proposed construction.

If you have questions, please feel free to call Mr. Kent Williams, Chief, New Source Review, at 404/881-4552 or Mr. Jeffrey Shumaker of TRW Inc. at 919/541-9100. TRW is under contract to EPA, and its personnel are acting as authorized representatives of the Agency in providing aid to the Region IV PSD review program.

Sincerely yours,

Kent Williams

for Tommie A. Gibbs, Chief
Air Facilities Branch

Attachment

REC'D - 12/29/80
FBI - ATLANTA
DEC 29 1980

by MAYOR'S OFFICE

PUBLIC NOTICE

A modification to an existing air pollution source is being proposed by the Tampa Electric Company near the city of Tampa, Hillsborough County, Florida. The proposed modification is the construction of a fourth coal-fired steam electric generating station with a 425 megawatt capacity. The modification will increase emissions of air pollutants by the following amounts in tons per year:

<u>SO₂</u>	<u>PM</u>	<u>NO_x</u>	<u>CO</u>	<u>VOC</u>
11,949	573	11,379	267	9

The maximum increment consumed by the proposed modification is as follows:

	<u>Annual</u>	<u>24-Hour</u>	<u>3-Hour</u>
SO ₂	5%	38%	32%
PM	-----Insignificant Impact-----		

Note that net increment consumption in the area may be less than the percentage indicated due to previous emissions reductions.

The proposed modification has been reviewed by the U.S. Environmental Protection Agency (EPA) under Federal Prevention of Significant Deterioration (PSD) Regulations (40 CFR 52.21), and EPA has made a preliminary determination that the construction can be approved provided certain conditions are met. A summary of the basis for this determination and the application for a permit submitted by Tampa Electric Company are available for public review in the office of Mr. Roger P. Stewart, Hillsborough County Environmental Protection Commission, 1900 9th Avenue, Tampa, Florida 33605.

Any person may submit written comments to EPA regarding the proposed modification. All comments, postmarked not later than 30 days from the date of this notice, will be considered by EPA in making a final determination regarding approval for construction of this source. These comments will be made available for public review at the above location. Furthermore, a public hearing can be requested by any person. Such requests should be submitted within 15 days of the date of this notice. Letters should be addressed to:

Mr. Tommie A. Gibbs, Chief
Air Facilities Branch
U.S. Environmental Protection Agency
345 Courtland Street, NE
Atlanta, Georgia 30308

APPENDIX E:

SO₂ CONTROL EQUIPMENT COST

APPENDIX E

Parameters and Procedures Utilized to Project Air Pollution Control Equipment Cost

Parameters

- 2-1,000 tpd facilities comprise the project.
- Each 1,000 tpd facility has two boilers each having air flow of 110,000 acfm.
- Desulfurization units have 90% removal efficiency.
- Sulfur content of solid waste is 0.2%.
- Interest on capital is 11.5%.
- Direct capital cost of wet and dry scrubber desulfurization equipment, based on one unit for each boiler is \$16 and \$24 per acfm respectively.
- Total cost of desulfurization equipment is direct capital cost times 1.5*.
- Electric power cost is 4 cents/kw.
- Disposal of waste generated by the desulfurization equipment is \$9.30/ton.
- All costs in 1981 dollars.
- Equipment amortization period is 20 years.
- Cost of lime is \$37.45/ton.

Procedures

- Projections of direct capital cost were obtained from several vendors and averaged to obtain \$24/acfm for dry scrubbers and \$16/acfm for wet scrubbers. It should be noted the dry scrubbing system requires a fabric filter which could be utilized for particulate control. This analysis considered the total cost of a dry scrubber system applied to SO₂ control. The wet scrubber is downstream of the electrostatic precipitator utilized for particulate control. The cost of an electorstatic precipitator was not included in the cost of a wet scrubber system.

* Includes design, financing, and etc. costs.

The operating costs of the dry scrubber system were derived from the paper "Dry System Emission Control for Municipal Incinerators" by Aaron J. Teller of Teller Environmental Systems, Inc. A yearly inflation factor of 10% was applied as appropriate.

The operating costs of the wet scrubber system were developed as described:

Electrical power usage was projected by using the following formulas:

$$\text{Fan brake hp}^A = \frac{(1.524 \times 10^{-4}(V_1)(8.5)}{0.851}$$

$$\text{Quencher Pump Brake hp} = \frac{(V_3)(2,180)}{2,968}$$

$$\text{Absorber Pump Brake hp} = \frac{(V_3) \times 2,180}{1,000} \\ 2,968$$

$$\text{Reagent Feed Pump Brake hp} = 20$$

$$\text{Amount of Lime} = (\text{lbs. SO}_2 \text{ removed/hr}) (9.1 \times 10^{-5})$$

Maintenance cost was projected to be 5% of the total capital cost.

Labor costs were projected as 2/3 of the labor costs for a dry scrubber system. The lower labor projection resulted from the lack of a fabric filter in the wet scrubber system.

hp = horsepower

V_1 = airflow in acfm

V_3 = $(520/\text{°F} + 460)(V_1)(1.26)$

The projection of the waste generated by a wet scrubber system was based on a generation curve applicable to coal fired facilities (See Figure 4-13 for "FGD Sludge Sidposal Manual" by the Electric Power Research Institute). The waste generated by a dry scrubber system was based on vendor supplied information.

PROJECTS MCKAY BAYSUBJECT SO₂ Control Equipment CostCOMPUTED JWS CHECKED _____DATE 7-9-71 PAGE 1 OF 12

Cost of Wet Process Equipment per acfm excluding
ESP:

Direct Capital Cost including ESP from O.B. Gas Cleaning Corp.

is \$32.50 per acfm or \$14,300,000; cost of
ESP's from information provided by VOP and
BFI is \$7,200,000; direct capital cost for
wet process equipment for SO₂ control is \$7,100,000
or \$16.1 / acfm

Direct Capital Cost for wet process equipment for SO₂
control excluding ESP's from Research - Cottrell
is \$6,000,000 or \$13.6 / acfm

use => \$16 / acfm

Cost of Dry Process Equipment per acfm
including Baghouse

Direct Capital Cost for 260,000 acfm unit is
\$21 per acfm; cost for 65,000 acfm unit
is \$26 / acfm according to O.B. Gas Cleaning Corp.
For a 110,000 acfm unit use \$24 / acfm

PROJECTS MCKAY BAYSUBJECT SO₂ Control Equipment CostCOMPUTED JWS CHECKED _____ DATE 7-7-81 PAGE 2 OF 12Direct Capital

Dry Scrubbers:

$$(2 \text{ facilities})(2 \text{ units/facility})(110,000 \text{ acfm})\left(\frac{24}{\text{unit}}\right)$$
$$= 10,560,000$$

Wet scrubbers:

$$(2 \text{ facilities})(2 \text{ units/facility})(110,000 \text{ acfm})\left(\frac{16}{\text{unit}}\right)$$
$$= 7,040,000$$

Total Capital Cost

Dry scrubbers:

$$(10,560,000)(1.5) = 15,840,000$$

Wet scrubbers:

$$(7,040,000)(1.5) = 10,560,000$$

* Obtained from contacts with DB Gas Cleaning Corp. and Research - Cottrell; see included correspondence and telephone memo and calculations on p.

** Includes design, financing, foundations and etc.

PROJECTS MCKAY BAYSUBJECT SO₂ Control Equipment CostCOMPUTED JWS CHECKED _____ DATE 7-10-81 PAGE 3 OF 12

Utility Cost for Wet Scrubbers

major cost is for energy to operate fans and pumps; develop cost for one boiler using information provided by DB Gas Cleaning Corp.

$$\text{fan brake hp} = \frac{(1.524 \times 10^{-4})(V_1)(8.5)}{0.85}$$
$$= 16.8$$

$$\text{brake hp}_{\text{quencher pumps}} = \frac{\left(\frac{V_2}{1,000}\right)(2,180)}{2,968}$$
$$= 60$$

$$\text{brake hp}_{\text{absorber pumps}} = \frac{\left(\frac{V_3}{1,000}\right)(2,180)}{2,968}$$
$$= 60$$

$$V_1 = 110,000 \text{ acfm}$$

$$V_2 = \left(\frac{520}{T_1 + 460}\right) \left(\frac{P_2}{P_1}\right) (V_1) = \left(\frac{520}{425 + 460}\right) (1) (110,000) = 64,633$$

$$\therefore V_3 = V_2 \times 0.92 \times 1.37 = (64,633)(0.92)(1.37) = 81,463$$

PROJECTS MCKAY BAYSUBJECT SO₂ Control Equipment CostCOMPUTED JWS CHECKED _____ DATE 7-10-81 PAGE 4 OF 12

$$\begin{array}{l} \text{brake h.p.} \\ \text{reagent feed} \\ \text{pumps} \end{array} = 20$$

$$\text{Total brake h.p.} = 308^*$$

$$= 230 \text{ kw/hrs}$$

Total system Energy Use:

$$\left(\frac{230 \text{ kw}}{\text{hr}} \right) \left(4 \text{ units} \right) \left(.82 \text{ availability} \right) \left(\frac{0.04}{\text{kw}} \right)$$

$$\left(\frac{8,760 \text{ kw}}{\text{yr}} \right) = * 264,342 / \text{yr.}$$

$$\text{use } * 264,000 / \text{yr.}$$

Utility Cost for Dry Scrubber

utility costs were based on system produced by Teller Environmental Systems, Inc. with adjustments for scale up and inflation and energy costs; see included paper entitled "Dry Systems Emission Control for Municipal Incinerators"

$$\text{Power cost} = \left(\frac{40,000 / \text{yr.}}{0.03 / \text{kwh}} \right) \left(\frac{0.04}{\text{kwh}} \right) (1.10)$$

$$\left(\frac{500}{300} \right)^{.9} (4) = * 370,771$$

$$\text{use } * 371,000$$

* Minor uses of energy such as agitators were ignored

** scaleup factor from "Guidance for Lowest Achievable Emission Rates from 18 . . . Organic Compounds; EPA-450/3-79-02

Att: Mr. Joseph Schilli

Re: Tampa Florida
Refuse Fired Power Plant

Dear Joe,

We are enclosing a general catalog which covers all the areas of equipment which DB Gas Cleaning supplies. We also enclose a copy of our Dry Absorption brochure which gives more details on our capabilities in this area.

For your budget planning on th Tampa plant we have generated the following figures. For 1000 ton/ day unit of gas flow is approximately 260,000ACFM. Dry Absorption System including absorption tower and baghouse furnished and installed, less foundations and electrical work, will cost between \$20.00 and \$22.00/ ACFM.

For this unit the utility requirements will be approximately:

reagent: 3,000lbs/hr

water: 60gpm

power: 150HP

compressed air: 1,000CFM at 100 psi

The utility usage for the smaller units will be proportional. For the 250 ton/ day smaller units with a gas flow of approximately 65,000ACFM we would estimate the dry scrubber system to cost approximately \$26.00/ ACFM.

-2-

With a wet type system is proposed for either the large or the small unit the cost would run approximately 30-35% more than a comparable dry system. The reagent usage would be approximately 10% less than with the dry system.

We appreciate your interest in DB Gas Cleaning equipment and we look forward to being of service to you and your client.

Sincerely,

DB GAS CLEANING CORPORATION

P.B. Slakey

BUDGET PRICINGI. Required Information

A. Gas Volume

1. Actual cubic feet per minute at specific temperature and pressure.

B. SO₂ Removal Requirement

1. Inlet SO₂ - lb./hr.
2. Outlet SO₂ - lb./hr.
3. Efficiency

II. Estimate

A. Tower size and number

1. From the inlet volume flowrate (V₁), temperature (T₁), and pressure (P₁), calculate standard volume flowrate (V₂).

$$V_2 = \frac{(520)}{(T_1 + 460)} \times (P_2/P_1) * V_1$$

Where T₁ = °F

2. From V₂ calculate saturated gas volume flowrate (V₃).

$$V_3 = V_2 \times 0.92 \times 1.37$$

3. From V₂ calculate cross section area of tower (A).

$$A = V_3 / 540$$

* At elevation 0'	P ₁ = 760 mm Hg	= P ₂ (standard)
3000'	P ₁ = 680 "	, P ₂ /P ₁ = 1.12
4000'	P ₁ = 655 "	, P ₂ /P ₁ = 1.16
5000'	P ₁ = 633 "	, P ₂ /P ₁ = 1.20
6000'	P ₁ = 610 "	, P ₂ /P ₁ = 1.25

II. Estimate

3. Continued

A. If $A > 1236 \text{ ft}^2$ (40' Ø), then more than 1 tower is required.

B. Table A is reference.

B. Budget Pricing

1. With size and number of towers use Graph I to determine budget price of FGD "standard scope".*

(a) "Standard Scope"

(i) includes

material & erection absorber trains complete with ducting, dampers, access, reheat, piping, pumping, instrumentation & controls, carbon steel construction with linings for corrosion protection

(ii) excludes

foundations, field electrical, site preparation, limestone unloading and long-term storage, primary and secondary dewatering.

2. Adders

(a) Alloy materials +20% (Graph I)

(b) Primary & secondary dewatering

(i) oxidized + 3% (Graph I)

(ii) unoxidized (thickeners)

- calculated thickener diameter (ft)
from:

$$\text{Dia.} = \sqrt{0.764 \text{ (lbs. SO}_2 \text{ removed/hr.)}}$$

- budget price from Graph II
add to oxidized adder of 3%

* In using Graph I for budget price for system comprised of 5 or more towers, add appropriate budget prices for 1 to 4 towers - e.g.

5 towers each 32' Ø add 4 @ \$21MM+1@ \$6.8MM

6 towers each 38' Ø add 4 @ \$27.3MM+2@ \$13.7MM

III. Process Information

A. Required Limestone

1. $(\text{lbs. SO}_2 \text{ removed/hr.}) \times (100/64) \times (1.05) \times (1/0.9)^* \times (1/2000) = \text{tons of limestone required per hour.}$

** stoichiometric ratio (95% utilization)

* limestone purity (90%)

B. Waste Generated

1. Unoxidized ($\text{Ca SO}_3 \cdot \frac{1}{2} \text{H}_2\text{O}$), "sulfite"

- a. $(\text{lbs. SO}_2 \text{ removed/hr.}) \times (129/64) \times (1/200) = \text{tons of Ca SO}_3 \cdot \frac{1}{2} \text{H}_2\text{O per hour.}$

(1) add 10% of required limestone (impurities).

b. for quantity of slurry leaving quencher divide (1) by 0.15 (15% solids).

c. for quantity of slurry leaving thickener (primary dewatering) divide (1) by 0.35 (35% solids).

d. for quantity of slurry leaving vacuum filters, divide (1) by 0.65 (65% slurry).

2. Oxidized ($\text{Ca SO}_4 \cdot 2\text{H}_2\text{O}$), "sulfite", "gypsum".

a. $(\text{lbs. SO}_2 \text{ removed/hr.}) \times (172/64) \times (1/2000) = \text{tons of gypsum/hr.}$

(1) add 10% of required limestone (impurities).

b. for quantity of slurry leaving quencher divide (1) by 0.15 (15% slurry).

c. for quantity of slurry leaving primary dewatering (hydroclones) divide (1) by 0.5 (50% solids).

d. for quantity of slurry leaving secondary dewatering (vacuum filters) divide (1) by 0.8 (80% slurry).

DRY SYSTEM EMISSION CONTROL FOR MUNICIPAL INCINERATORS

AARON J. TELLER
Teller Environmental Systems, Inc.
Worcester, Massachusetts

ABSTRACT

The control of gaseous and particulate emissions from municipal incinerators well within regulatory limits, with essentially zero opacity, requiring skills already available in the facility, and with a solid discharge has been demonstrated in commercial installations in the U.S.A. and Japan.

INTRODUCTION

The disposal of municipal waste is a microcosm of our total pollution problem. The mere disposal of the waste creates additional pollution problems. Landfill creates leaching pollution. Reduction of volume by combustion creates air pollution and solid waste disposal. Scrubbing creates liquid waste. Yet, as in all other pollution problems, recovery of useful values can be achieved, thermal value by incineration, materials recovery by sorting and separation.

The most effective process for disposal of solid waste thus far developed is incineration, often coupled with thermal recovery. A significant reduction in mass is achieved and heat is recovered. There are still, however, gaseous and particulate emissions that must be contained.

The noxious gaseous emissions and the range of concentrations encountered are:

Compound	ppm
HCl	50-1500
SO ₂	20-250
HF	3-30

The particulate concentration is of the order of 5 g/Nm³ with a significant level (>30 percent) of submicron particulate.

The higher concentrations of HCl (~1000 ppm) are generally present in the combustion gases emitted in European and Japanese incinerators. The concentrations of HCl in U.S. and Canadian incinerators are, at present, of the order of 50-300 ppm. The indications are that these will rise as the trend toward plastic packaging increases to the level present in European and Japanese incinerators.

Regulations regarding HCl emissions are:

Japan	250 ppm
Germany	200 ppm
Italy	50 ppm
U.S.A.	No Federal requirements

In the U.S., particulate emissions are restricted by EPA to 0.22 g/Nm³ corrected to 12 percent CO₂ for existing incinerators and 0.18 g/Nm³ corrected to 12 percent CO₂ for new installations. With normal good practice for incinerator operation these values are equivalent to 0.11 g/Nm³ and 0.09 g/Nm³ respectively for the outlet gas. Some states are more restrictive with permissible emissions as low as 50 percent of the recommended EPA regulations.

Opacity is generally restricted to less than 20 percent.

European and Japanese practice in meeting the particulate and acid gas regulations had been the

use of electrostatic precipitators for particulate removal followed by wet scrubbing for the removal of acid gases. This practice is frowned upon by authorities because of the requirement for discharge of liquid waste and the appearance of a pervasive plume if the particulate is not reduced below 0.04 g/Nm³ and acid gas concentrations below 20 ppm.

Thus, a more acceptable and more economically viable process was required in order to meet the regulatory requirements and the financial capability of the communities, the producers of solid waste.

The criteria for an emission control system for incineration are as follows:

1. Compatibility with skills available in the operators of incinerators.
2. Reduction of particulate emissions to levels consistently below the regulatory requirements.
3. Future capability for reduction of acid gas emissions to levels below the most stringent requirements established in other countries.
4. Reduction of visible plume to opacities below 10 percent.
5. Prevention of liquid discharge.

The reasons for these criteria are as follows:

TABLE 1 SYSTEM CHARACTERISTICS FOR MUNICIPAL INCINERATOR EMISSION CONTROL

Compatibility	Material handling skills
Particulate	Emissions less than 0.1 g/Nm ³ (corr. 12 percent CO ₂)
Acid Gas	Emissions less than 10 ppm
Plume	Less than 10 percent
Discharge	To be solid

1. Compatibility — If new skills are required beyond material handling, additional manpower must be added. A three-man addition is equivalent to a capital investment of \$750,000 per installation.

2. Particulate — The trend in incinerator regulation based on state of the art is toward a particulate level of 0.1 g/Nm³ corrected to 12 percent CO₂. In addition, emissions above 0.04 g/Nm³ will result in a visible stack emission because of nucleation of the particulates in the humid exhaust.

3. Gas Emissions — Inasmuch as other countries and individual communities have already placed restrictions on acid gas emissions and EPA is now evaluating the technology, there will probably be government pressure to control these emissions in

the near future. In addition, high concentrations of acid gases in a humid stack result in an intensification of plume appearance.

4. Plume Appearance — The opacity of a steam plume is a function of particulate and acid gas content as well as ambient conditions. Since the inherent humidity in incineration is equivalent to a dew point range of 115-140°F (66°C-88°C), the potential for plume appearance even without additional humidification is high.

5. Liquid Discharge — The original mode of acid gas recovery was via scrubbing subsequent to an electrostatic precipitator. This not only resulted in plume intensification but a complex water treatment system as well as discharge of soluble chloride and fluoride salts. Both Japan and Germany have placed approval restrictions on such installations.

As a result of this evaluation, it was determined that a dry scrubbing system was essential to meet all the criteria. The system consists of the following components [1-3] (Fig. 1).

1. Quench Reaction — The simultaneous reduction in temperature and neutralization of acid gases by a size-temperature responsive spray of a neutralizing agent, resulting in a dry particulate product at the outlet of the unit.

2. Submicron particulate capture in the duct via use of a "dry venturi" providing the efficiency of particulate capture equivalent to an 80 in. w.g. (20 kPa) wet venturi but operating at a 1/2 in. w.g. (0.1 kPa) pressure drop.

3. Filtration of the entire gas by a baghouse or an electrostatic precipitator. Because of the removal of acid gases the acid dew point no longer controls the operating temperature of the electrostatic precipitator.

The proprietary quench reactor (upflow with large particulate removal or downflow) has a responsive droplet size mechanism such that lower inlet temperatures result in the formation of smaller droplets. Inasmuch as vaporization rates are lower with lower inlet temperatures, the smaller droplet size compensates for this decrease in kinetics, thus establishing consistent performance.

The dry venturi, [4] installed as a spool piece in the duct provides for the capture of the hydrophobic submicron particulates at a pressure drop of ½ in. w.g. (0.1 kPa) with a capture efficiency equal to that achieved in an 80 in. w.g. (20 kPa) pressure drop wet venturi (Table 2). The targets are solid and available locally.

FIG. 1 FLOW SHEET WITH BUGHOUSE AND ELECTROSTATIC PRECIPITATOR

TABLE 2 COMPARISON OF PREDICTED CAPTURE PERFORMANCE:
Wet Venturi and Dry Venturi

Particle Size Captured Microns	Wet Venturi		Dry Venturi Capture		\$/ton Less Amortiza- tion
	ΔP mm H ₂ O	Efficiency Percent	ΔP mm H ₂ O	Efficiency Percent	
0.3	250	54-64	15	85-90	
	630	72-78			
	1250	80-86			
	2000	82-90			
0.5	250	77-80	15	92-95	
	630	84-90			
	1250	88-95			
	2000	92-99			
1.0	250	88-95	15	99-100	
	630	94-100			
	1250	96-100			
	2000	100			

The neutral salts created in the quench reactor, the agglomerated particulates from the dry venturi, and the supermicron particulates from the incinerator may now be removed from the gas stream by either a baghouse or an electrostatic precipitator.

TABLE 3 TOTAL OPERATING COSTS - TELLER EMISSION CONTROL SYSTEM - MUNICIPAL INCINERATORS (BAGHOUSE)

	\$/yr	\$/ton	
Lime (\$35/ton)	6,500	0.072	
Power (\$0.03/kWh)	58,500	0.650	
TESISORB (\$35/ton)	18,000	0.200	
Amortization (15 year)	133,000	1.477	
Labor (\$20,000/MY)	20,000	0.220	
Maintenance	25,000	0.278	
Total	261,000	2.897	1.420
		(3.193/t)	(1.565/t)

If no precipitator is presently installed, the baghouse is preferred. The bases are lower capital cost and acid gas removal.

In conjunction with dry venturi operation, the baghouse shake cycle is extended to 12-18 hr inasmuch as the major portion of the submicron particulates are agglomerated. Thus, the rate of pressure drop rise is minimal and the shake cycle is

FIG. 2 ISOGO PILOT UNIT

FIG. 3 ISOGO HCl TESTS

small. As a result, a thick cake is created in the baghouse.

The result is a flywheel effect. It is known that the acid gas emissions from an incinerator are highly variable. If all of the neutralization is to be conducted in the quench reactor, then either the quantity of neutralizing agent must be introduced responsively to the inlet concentration or, in order to avoid the unreliability of analytical instrument response, the neutralizing agent feed rate must be fed at the maximum requirement.

However, because the Teller system permits a buildup of solids in the baghouse, an *average* rate of reagent feed is permissible. During low acid gas emission periods, the excess reagent accumulates in the cake, and is available for reaction during high acid gas emission periods.

The behavior pattern of a constant system emission with variable inlets was observed in pilot tests at Isogo, Yokohama (Figs. 2 and 3).

The overall acid gas performance for the baghouse system is reduction from 300-1000 ppm

HCl to 3-6 ppm and 50-250 ppm SO₂ to 5-30 ppm. Particulate emissions are of the order of 0.06 g/Nm³ corrected to 12 percent CO₂.

Where an electrostatic precipitator is used as the final downstream collector, the acid gas performance is still within acceptable range with a 90 percent efficiency for HCl and an 85 percent efficiency for SO₂.

The system (Fig. 1) has the following characteristics:

1. Compatibility
Primarily solids handling one slurry handling system
2. Particulate
Emissions less than 50 percent of present requirements (EPA)
3. Gas Emissions
Approximately 15 percent of the lowest required internationally
4. Plume Appearance
Zero opacity when the ambient temperature

is above 50°F (10°C). With ambient temperature below 50°F (10°C) a disconnected steam plume is evident with a rise of approximately 100 ft (30 m).

5. Discharge

Solid product - free flowing.

The overall system pressure drop is approximately 8 in. w.g. (1.99 kPa).

For a 300 tpd (272 t/d) municipal incinerator the estimated operating costs for 300 operating days/yr are shown in Table 3.

For retrofit of an existing electrostatic precipitator installation, costs are shown in Table 4.

FIG. 4 FRAMINGHAM INSTALLATION

TABLE 4 TOTAL OPERATING COSTS - TELLER EMISSION CONTROL SYSTEM - MUNICIPAL INCINERATORS - ELECTROSTATIC PRECIPITATOR

	\$/yr	\$/ton	\$/ton Less Amortiza- tion
Lime (\$35/ton)	10,000	0.111	
Power (\$0.03/kWh)	40,000	0.444	
TESISORB	18,000	0.200	
Amortization (15 year)*	180,000	2.000	
Labor (\$20,000/year)	20,000	0.220	
Maintenance	80,000	0.899	
Total	348,000	3.864	1.864
		(4.259/t)	(2.055/t)

* If not paid off prior to installation of Teller components.

Thus total emission control compatible with the needs of the community and with acceptable discharge from aesthetic, pollutant, and by product characteristics can be achieved within reasonable economic limits. This has been demonstrated on a 300 tpd (272 t/d) municipal incinerator in Framingham, Massachusetts (Fig. 4) and a 150 tpd (136 t/d) municipal incinerator at Yokohama, Japan.

APPENDIX F:
WASTE QUANTITIES

Waste Quantities

A. PURPOSE

To verify the annual quantity of solid waste generated in Hillsborough County and determine if a solid waste generation rate of 4.3 lb/cap/day determined previously should be used for resource recovery procurement activities.

B. SUMMARY

- a) This analysis indicated that 539,400 tons rather than the projected 495,000 tons was disposed of in Hillsborough County in 1980. We propose the use of the lower tonnage as the basis for the RFP procurement documents.
- b) The analysis showed a unit waste generation rate of 4.7 lb/cap/day which was higher than the projected rate of 4.3 lb/cap/day. To conservatively estimate the quantities, we propose the use of the lower rate of 4.3 lb/cap/day as the basis for the RFP procurement documents and when it is to the County's advantage, increase the baseline quantities.

C. DISCUSSION

1. Introduction

As part of the work program, solid waste records were collected and analyzed to determine an appropriate waste generation rate to be used to estimate future waste quantities generated in Hillsborough County. The previous consultant, Brown & Caldwell, used a unit waste generation rate

of 4.3 pounds/capita/day. HDR will determine if this waste generation rate is appropriate based upon the additional year of data that has been collected since Brown & Caldwell did their analysis in 1979. The updated unit waste generation factor will be used to estimate the future quantities of solid waste that will have to be accommodated by a solid waste management system.

2. **Waste Quantities**

Two sanitary landfills are currently in operation in Hillsborough County: the Northwest Landfill and Hillsborough Heights. These two landfills receive all of the waste disposed in the County. In the past, other landfills were also used.

The Ruskin Landfill was operational until August 1978 when its waste was diverted to the Taylor Road Landfill. Plant City's landfill was operational through September 1979 when its waste was diverted to the Taylor Road Landfill. Furthermore, the Tampa Incinerator was operational until December 1979, when its waste was also diverted to the Taylor Road Landfill. The Taylor Road Landfill was replaced by the Hillsborough Heights Landfill and daily operation was contracted to Waste Management, Inc. on February 11, 1980. Hillsborough County also operates the South County Transfer Station which hauls all of its waste to the Hillsborough Heights Landfill.

Scale data from the Hillsborough Heights Landfill is available for most of 1980. Scale data of the incoming waste stream is also available from the Transfer Station. Other pertinent data concerning the waste stream includes estimates of the total volume in cubic yards of the waste going to the landfills which do not or did not operate scales. For the months when no information on the waste stream was available; reasonable estimates of the incoming waste were made by the scale attendants.

**TABLE A-1 - HILLSBOROUGH COUNTY
1980 SOLID WASTE DATA BY MONTH**

	Northwest Landfill Estimated <u>Cu. Yards</u>	Hillsborough Heights Est. Tons @ <u>350 lb/c.y.</u>		Total <u>Tons</u>
Jan.	53,206	9,311	28,896	38,207

Plant City	---	10,514	---	8,370 (1)
Ruskin	55,844 (2)	9,773	Closed	Closed
Total	1,837,215	512,027	1,750,972	503,527

(1) The Plant City Landfill closed October 1, 1979 and the waste was diverted to the Taylor Road Landfill.

(2) The Ruskin Landfill closed August 1, 1978 and the waste was diverted to the Taylor Road Landfill.

Special Note: Waste quantities contain some white goods, demolition waste and tires.

Another minor problem with the 1980 waste quantities is that not all incoming vehicles using the Hillsborough Heights Landfill crossed the scale. For example, some cars, some tire loads, and some cash customers bypassed the scales. Records indicate that an average of 3100 cars and pickup trucks bypassed the scales each month in 1980. The peak number of cars and pickup trucks that passed the scales was 3428 vehicles in August 1980. The least amount of cars and pickup trucks bypassing the scales occurred during November when 2765 vehicles were recorded. The quantities hauled by these types of vehicles was determined to be insignificant. But, beginning in 1981, all incoming wastes will be weighed at Hillsborough Heights. This operating requirement will improve the data for future solid waste management planning activities in Hillsborough County.

3. Population Projections

Table A-3 lists the estimated population projections for Hillsborough County. These projections were obtained from the Hillsborough County City-County Planning Commission publication entitled, "Population and Housing Estimates, April 1, 1970 - April 1, 1980."

TABLE A-3 - POPULATION PROJECTIONS FOR HILLSBOROUGH COUNTY

<u>Year</u>	<u>Population Projection</u>
1980	630,698
1985	757,300
1990	848,500
1995	939,300
2000	1,030,000

4. Unit Waste Generation Factor

The unit waste generation factor is simply a per capita waste generation rate. The factor is calculated by dividing the total tonnage of waste disposed by the contributing population. Using the data presented in Table 4 and a countywide population of 630,698, the County's unit waste generation factor for 1980 was computed to be 4.7 pounds per capita per day. The 1979 data indicated a 4.7 pounds per capita per day was computed. The 1978 data equated to 4.8 pounds per capita per day rate.

In previous analyses, a unit waste generation rate of 4.3 pounds per capita per day was determined. This rate is approximately 8.5% less than the rate computed by HDR and this differential is small when determining unit waste generation rates. To be conservative, the 4.3 pounds per capita per day rate will be used in projecting waste quantities delivered to resource recovery facilities.

From our perspective, the unit factor of 4.3 pounds per capita per day is a reasonable estimate when compared to unit waste generation factors found in other HDR projects such as Pinellas County, Florida; DeKalb County, Georgia; Fort Worth, Texas; and Phoenix, Arizona. Furthermore, it is assumed that the unit waste factors will remain constant in the future. This assumption provides a reasonable compromise between past predictions of rising per capita waste generation rates and some recent indication of the trend toward slight decreases in the per capita waste generation rates.

Table A-4 lists the solid waste tonnage projections for Hillsborough County. These projections are based on the population projections listed in Table 3 and a constant unit waste generation rate of both 4.7 and 4.3 pounds per capita per day.

TABLE A-4 - SOLID WASTE PROJECTIONS FOR HILLSBOROUGH COUNTY

<u>Year</u>	<u>Waste Quantity (Tons)</u> <u>4.7 lb/cap/day</u>	<u>Resource Recovery</u> <u>Quantity</u> <u>4.3 lb/cap/day</u>
1980	539,000	495,000
1985	647,000	594,000
1990	725,000	666,000
2000	880,000	808,000

5. Seasonal Variations

Figure A-1 depicts the seasonal variation of waste quantities for the years 1978, 1979 and 1980. Figure A-2 gives reference to which months are above or below the average monthly waste generation percentage of 8.33% (100% - 12 months = 8.33%).

6. Solid Waste Composition

Local solid waste composition data was extracted from the Phase II Project Draft Report. This sampling program determined the composition of the municipal solid waste stream in Hillsborough County.

The sampling survey spanned six continuous days per month in each of the following months: November 1979, February 1980, May 1980 and August 1980.

Table A-5 summarizes the seasonal variation in the waste stream composition. The percentage of combustibles was the highest at 89.8% in August 1980, and the lowest at 80.3% in February 1980.

Table A-6 illustrates the seasonal variation of the higher heating value and moisture content of the solid waste. The heating value was lowest in May 1980, the highest values occurred in the months of November 1979 and August 1980. This local data correlates reasonably with HDR and other's sampling programs listed in Table A-7 and its use should provide a reasonable basis for the procurement activities.

Special wastes can comprise a significant amount of the waste that is landfilled. Included in these wastes are large amounts of shrimp, tires, dead animals, lumber, and construction wastes. These non-processable wastes will go directly to the landfills and bypass any waste processing facilities. By selecting the 4.3 unit waste generation rate, we are of the opinion the special wastes have been adequately included in the total waste quantities listed in Table 4.

TABLE 4

For the purposes of RFP procurement it is assumed that the waste stream delivered to resource recovery facilities will have the following characteristics:

Combustibles	-	80%
Ferrous	-	5%
Aluminum	-	1%
Other Non Ferrous Metals	-	0.1%
Average higher heating value	-	4500 Btus/lb. @ moisture content of 30%

E. **CONCLUSIONS:**

The primary purpose of this analysis was to confirm the quantity of waste that would be available for resource recovery in Hillsborough County. Our analysis indicated that more than the 1980 projected tonnage of 495,000 tons was disposed. Our analysis indicated that approximately 539,400 tons were disposed during 1980.

Since all waste is now being weighed at the Hillsborough Heights Landfill, we are proposing to use for the RFP procurement documents the lower tonnage of 495,000 tons (4.3 lbs/capita/day) as the basis for future projections. We will monitor the additional records and as more definitive data becomes available, we may recommend an increase in the quantity available for resource recovery when it is advantageous to the county.

ACTION: Final rules.

SUMMARY: In response to the decision of the U.S. Court of Appeals for the D.C. Circuit in *Alabama Power Company v. Castle*, EPA is today amending its regulations for the prevention of significant deterioration of air quality. 40 CFR 51.24, 52.21. Today's amendments also include regulatory changes affecting new source review in nonattainment areas, including restrictions on major source growth (40 CFR 52.24) and requirements under EPA's Emission Offset Interpretative Ruling (40 CFR Part 51, Appendix S) and Section 173 of the Clean Air Act (40 CFR 51.18 (j)).

DATES: The regulatory amendments announced here come into effect on August 7, 1980. State Implementation Plan revisions meeting today's regulatory changes are to be submitted to EPA within nine months after this publication.

FOR FURTHER INFORMATION CONTACT: James B. Weigold, Standards Implementation Branch (MD-15), Office of Air Quality Planning and Standards, Research Triangle Park, N.C. 27711, 919/541-5292.

SUPPLEMENTARY INFORMATION: The contents of today's preamble are listed in the following outline. A section entitled Summary of PSD Program has been added to provide a concise narrative overview of this program.

 - G. Economic Impact Assessment
 - H. Consolidated Permit Regulations

I. Summary of PSD Program

The purpose of this summary is to help those people who are unfamiliar with the PSD program gain an understanding of it. Because this

summary seeks to condense the basic PSD rules, it may not precisely reflect the amendments announced in this notice. Should there be any apparent inconsistency between the summary and the remainder of the preamble and the regulations, the remaining preamble and the regulations shall govern.

A. PSD Allows Industrial Growth Within Specific Air Quality Goals

The basic goals of the prevention of significant air quality deterioration (PSD) regulations are (1) to ensure that economic growth will occur in harmony with the preservation of existing clean air resources to prevent the development of any new nonattainment problems; (2) to protect the public health and welfare from any adverse effect which might occur even at air pollution levels better than the national ambient air quality standards; and (3) to preserve, protect, and enhance the air quality in areas of special natural recreational, scenic, or historic value, such as national parks and wilderness areas.

States are required to develop SIP revisions for PSD pursuant to regulations published today. See 40 CFR 51.24, "Requirements for Preparation, Adoption and Submittal of Implementation Plans." If EPA approves the proposed PSD plan, the state can then implement its own program. In the absence of an approved state PSD plan, another portion of today's regulations will govern PSD review. See 40 CFR 52.21, "Approval and Promulgation of Implementation Plans." EPA will implement this regulation itself if the state does not submit an approvable PSD program of its own.

States can identify in their SIPs the local land use goals for each clean area through a system of area classifications. A "clean" area is one whose air quality is better than that required by the National Ambient Air Quality Standards. Each classification differs in the amount of growth it will permit before significant air quality deterioration would be deemed to occur. Significant deterioration is said to occur when the amount of new pollution would exceed the applicable maximum allowable increase ("increment"), the amount of which varies with the classification of the area. The reference point for determining air quality deterioration in an area is the baseline concentration, which is essentially the ambient concentration existing at the time of the first PSD permit application submittal affecting that area. To date, only PSD increments for sulfur dioxide and particulate matter have been established. Increments or alternatives

Administrator did not intend to require BACT. For example, the proposal could be interpreted as requiring BACT review for any pollutant emitted from a source that was modified, regardless of whether the emissions of the pollutant increased. However, that was not the Agency's intent.

If a new unit were added or if a modification were made to a unit at a source, but there are contemporaneous decreases in emissions elsewhere at the source, BACT is required only for the pollutants for which there is a net significant plant-wide increase. For example, consider the addition of a boiler whose emissions of PM, SO₂, and NO_x each exceed *de minimis* levels. If, at the same time, an emission unit of SO₂ elsewhere at the source were shut down, such that plant-wide emissions of SO₂ either do not increase or increase by less than a *de minimis* amount, BACT is required for the new boiler only for PM and NO_x. Of course, BACT will not be required if there is no significant plant-wide increase in emissions of any pollutant. Similarly, if an existing emissions unit of a source were modified such that there is an emissions increase for one or more pollutants, but not all, BACT is required only for the pollutants for which there is both a net increase at the unit and a net significant plant-wide increase.

The above final policy governing the applicability of BACT to modifications is also consistent with existing policy under section 111, which the court said should govern modification concerns. The applicable regulation, 40 CFR 60.14(a), states that "any physical or operational change to an existing facility which results in an increase in the emissions rate to the atmosphere of any pollutant to which a standard applies shall be considered a modification within the meaning of section 111 of the Act. Upon modification, an existing facility shall become an affected facility for each pollutant to which a standard applies and for which there is an increase in the emissions rate to the atmosphere." (Emphasis added.)

The regulation cited above makes two important statements about the applicability requirements. First, the BACT requirements apply only with regard to those pollutants for which there has been a net significant increase. This was emphasized by the Alabama Power decision: "Congress wished to apply the permit process, then only where industrial changes might increase pollution in an area, not where an existing plant changed its operations in ways that produced no pollution increase The interpretation of

'modification' as requiring a net increase is thus consistent with the purpose of the Act The EPA has properly exempted from best available control technology (BACT) and ambient air quality review those 'modifications' of a source that do not produce a net increase in any pollutant." 13 ERC at 2043.

Second, BACT is required for net significant increases of *any* pollutant regulated under the Act, regardless of the category of source involved or the emissions standards generally applicable to it. Section 165(a)(4) of the Act requires application of BACT "for each pollutant subject to regulation under this Act" emitted from a subject facility. 42 U.S.C. 7475(a)(4). This includes not only criteria pollutants but also all pollutants regulated under NSPS or NESHAP. In this manner, BACT can complement the NSPS process by extending coverage to additional source types and units and perhaps identifying candidates for future NSPS and NESHAP regulations.

XVI. Monitoring

In *Alabama Power*, the court held that section 165(c)(1) of the Act requires an ambient air quality analysis for each pollutant subject to regulation under the Act that a proposed source or modification would emit, prior to applying for a PSD permit. Since existing PSD regulations require monitoring only for criteria pollutants emitted in major amounts, EPA responded to the June 18, 1979 *per curiam* opinion by proposing to require, for criteria and noncriteria pollutants, an air quality analysis that would generally include monitoring data. In order to gather and analyze the appropriate data necessary to apply for a PSD permit, a proposed source would have to establish an appropriate monitoring network or would have to gather and analyze representative air monitoring data resulting from ongoing monitoring activities.

As proposed, preconstruction monitoring data was required as part of the air quality analysis when: (1) the estimated ambient impact of any new pollutant emissions from the stationary source or modification would be larger than the pollutant specific *de minimis* air quality concentration (Table B); or (2) the new emissions or net emissions increases for the pollutant would be major (100/250 tons per year). In addition to this rule, EPA proposed that a case-by-case analysis of the proposed stationary source or modification which would impact on a Class I area be conducted even though the anticipated impact would fall below the *de minimis* level. Later, in October 1979, EPA

provided further guidance for applying these requirements in the draft revision of the *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)*, OAQPS-1.2-090, U.S. EPA, Office of Air Quality Planning and Standards and Office of Research and Development, RTP, NC 27711.

The proposal stated that certain noncriteria pollutants (sulfuric acid mist, carbon disulfide, carbonyl sulfide, methyl mercaptan, dimethyl disulfide, and dimethyl sulfide) were lacking measurement methods approved by EPA. Until such time as approved techniques would become available, the Agency proposed to use mathematical modeling to estimate the air quality resulting from the emissions of these pollutants. Considering these limitations and the general lack of experience in monitoring on a routine basis, the Administrator proposed to implement noncriteria pollutant monitoring requirements on a case-by-case basis.

In addition to the pre-application monitoring requirements already described, EPA's proposal included discretionary authority for requiring post-construction monitoring to determine the effects of the new emissions on existing air quality. For cases in which larger pollutant emission impacts are anticipated, post-construction monitoring can be a particularly useful aid in adjusting modeling results used to predict concentrations resulting from the source's operation. The approach was thought to be responsive to the *Alabama Power* decision which required EPA to use monitors to help refine modeling techniques. Accordingly, EPA proposed to generally require post-construction monitoring from large sources of particulate matter and sulfur dioxide. Other sources whose emissions are estimated to result in air quality levels approaching an allowable increment or a NAAQS could also be required to submit post-construction monitoring data. The rule promulgated today is consistent with the proposal.

The Administrator believed that the required monitoring data would be most productive in checking the accuracy of models and, in some cases, could be used to calculate increment consumption. If an applicant or other party believes that a model required by EPA had either overpredicted or underpredicted the air quality impact of a source, EPA stated that monitoring data would be evaluated to the extent possible to determine whether adjustments would be necessary. EPA anticipated that the future development of more sophisticated monitoring

techniques may permit increased use of monitoring data to track increment consumption and establish ambient baselines, as well as improve the level of confidence in modeling.

Lastly, EPA considered the approach needed to smoothly usher in the new monitoring requirements. The September 5 *Federal Register* indicated that EPA intended to require any additional monitoring requirements, as now necessary under *Alabama Power*, to be phased in. Later, in October 1979, the draft ambient monitoring guidelines specified that a three-month allowance would be subtracted from the time interval over which the owner must monitor to allow for procuring and setting up the necessary monitoring equipment. (See Transition).

There was a large response to EPA's proposal and draft monitoring guidelines—nearly 100 public comments and over 800 requests for the guidance document were received. The comments indicated general agreement with EPA's interpretation of the court's preliminary opinion. But some concern was expressed over certain specific portions of the proposal: (1) the limited technology available to monitor the noncriteria pollutants in the ambient air; (2) the large cost associated with gathering all the required air quality data for all regulated pollutants; (3) the identification process for "representative" data; and (4) the need for post-construction monitoring.

Subsequent to the publication of the September 5, 1979 proposal and the receipt of the public comment, the court issued its final decision on December 14, 1979. One important change the court made upon reconsideration of the June 18 opinion was "that section 165(e)(1) requires that *an analysis* be conducted, and that it be conducted for each pollutant regulated under the Act. But * * * that section 165(e)(1), standing alone does not require monitoring as the method of analysis to be employed in the fulfillment of its requirements." 13 ERC 1993, 2019. This ruling gave EPA more flexibility in defining the minimum requirements for a proper analysis of the noncriteria pollutants. "EPA might * * * choose either monitoring or modeling as the method of analysis * * * *Id.* In other monitoring issues the court essentially affirmed its preliminary opinions.

Today, the Administrator is promulgating the proposed monitoring requirements with the noted exceptions. (See 40 CFR 51.24(m), 52.21(m)). EPA will generally require one year's worth of monitoring data as part of the air quality analysis for only the criteria pollutants. For the noncriteria and

hazardous pollutants, modeling, not monitoring, will be the mechanism used to perform most detailed air quality analyses. However, there may be certain circumstances where monitoring may be the only option available to perform an adequate analysis for the noncriteria pollutants (e.g., when little or no data on emission inventories for the area of concern exist). In that case, EPA will require ambient monitoring for the noncriteria pollutants if there is an acceptable method for the monitoring of that pollutant. Presently, the Administrator has acceptable methods for measuring ambient concentrations of: (1) all the criteria pollutants; (2) mercury; (3) beryllium; (4) vinyl chloride; (5) fluorides; and (6) hydrogen sulfide. A list of acceptable methods and copies of the method description are available by writing to: U.S. EPA, Environmental Monitoring Systems Laboratory, Quality Assurance Division (MD-77), Research Triangle Park, N.C. 27711. Also, techniques to measure ambient total reduced sulfur and reduced sulfur compounds have been chosen and will be added to the list within the next several months. At this time there are no acceptable methods for measuring ambient levels of asbestos and sulfuric acid mist.

As EPA gains more experience from the PSD program with respect to noncriteria pollutant analysis and as the technology develops, the Administrator will consider an increased role for ambient monitoring within the required air quality analysis.

In addition to the exemptions given in the *de minimis* section of this *Federal Register* publication, EPA may not always require a source owner to establish a monitoring network when the data would not validate or improve the estimates made by the mathematical models. When the existing air pollution levels are conservatively estimated to be quite small and a monitoring network could not reliably measure the predicted background concentrations, EPA will generally not require the source owner to generate preconstruction monitoring data. Also, if the source owner has submitted preconstruction data for the source site, and the post-construction monitoring network could not measure a predicted degradation in the air quality, then EPA will generally not require the source owner to collect further monitoring data. More guidance for meeting all the monitoring requirements is given in the *Ambient Monitoring Guidelines for Prevention of Significant Deterioration* (PSD), EPA-450/4-80-012, July 1980, available from the Monitoring and Data Analysis Division, OAQPS.

(MD-14), U.S. EPA, Research Triangle Park, N.C. 27711.

In the September 5, 1979 proposed regulations and the October 1979 draft of *Ambient Monitoring Guidelines for Prevention of Significant Deterioration* (PSD), EPA solicited comments on the use of representative air quality data to satisfy PSD monitoring requirements. Thirty-nine comments were received on the various aspects of the use of representative air quality data. The major responses were as follows: twenty-four commenters supported the use of existing representative air quality data, especially for remote areas. Five commenters wanted EPA to allow the use of bubbler data in lieu of continuous monitoring data, seven respondents believed that data older than two years should be allowed, and three objected to the quality assurance requirements for the representative data.

EPA has considered all of the comments and has taken the following actions:

(1) The use of existing representative air quality data will be permitted in lieu of monitoring, provided that the data meet the criteria in the above reference guideline.

(2) No bubbler data will be permitted because the data should be of the same quality as that obtained if the applicant monitored according to the requirements in the above referenced guideline. This guideline specifies monitoring must be done with continuous instruments to eliminate measurement biases associated with bubbler data.

Continuous measurements are also more suitable for routine monitoring purposes in checking for compliance with short-term standards.

(3) EPA will allow the use of data, for preconstruction purposes only, collected in the three-year period preceding the permit application provided reference/equivalent quality assurance procedures were followed during the measurement period. The draft guideline has previously specified a two-year requirement.

(4) EPA reaffirms the intent that all monitoring data collected must have been collected in accordance with acceptable quality assurance procedures. The specifics of the minimum quality assurance program needed for collecting air quality data are contained in the referenced guideline.

Finally, the court held that EPA had failed to provide concrete guidance to the states for designating when less than one year of monitoring data would meet the required air quality analysis, as specifically allowed under section 165(e)(2). Such guidance is given under

APPENDIX J:
LOWEST ACHIEVABLE EMISSION
RATE (LAER)

**STATE'S IMPLEMENTATION PLAN
LOWEST ACHIEVABLE EMISSION RATE (LAER)**

<u>STATE</u>	<u>LAER LOCATION</u>	<u>LAER</u>
Alabama	301:0509 Chapter 3, 3.2.2	1 lb/100lb refuse charged in incinerators of more than 50 tons/day. 2 lb/100 lb of refuse charged in all others.
Alaska	306:0502 18 AAC, 50.40	.3 gr/dscf for incinerators 1b/hr, .2 gr for 200 1000 .1 gr for 1000 lb/hr.
