COMMENTS: An unannounced compliance inspection of the Bill Doyle Cleaners was conducted on January 29, 2008. During the inspection a review of facility records was conducted, as well as a walk through of the facility. Facility records show that 100 gallons of perchloroethylene (perc) was purchased during 2007. Weekly leak inspections are being documented as well as perc purchases and condenser exhaust temperatures. Adequate secondary containment is provided for all perc related units and containers. Hazardous waste are properly contained and shipped off site by MCF Systems of Atlanta. At the time of the inspection, the facility appeared to be in compliance with permit requirements.

RECOMMENDATIONS:

On July 27, 2006, the Environmental Protection Agency (EPA) strengthened air toxics requirements for all dry cleaners that use the chemical perchloroethylene (PERC).

The rule affects three types of dry cleaners that use PERC: large industrial and commercial dry cleaners; small area source dry cleaners (found in strip malls or stand-alone); and small dry cleaners located in residential buildings. The majority of dry cleaners in Florida are small area source dry cleaners.

Requirements for existing area source dry cleaners (machines installed prior to December 21, 2005)

Begin using a halogen leak detector monthly by July 27, 2008 to detect PERC leaks and maintain records.
