**COMMENTS:** Perchloroethylene (PCE) leak inspections are conducted weekly using a halogenated hydrocarbon detector. A leak detection inspection was conducted while on site and the instrument was operated according to manufacturer's instructions. The PCE leak detector is capable of detecting PCE concentrations of 25 ppm or lower. Inspection records, PCE purchase receipts and spare parts receipts were up to date. Purchase receipts for 117 gallons of PCE matched those recorded on the calendar. Records for the PCE machine were up to date and well-maintained. The refrigerated condenser outlet temperature is monitored weekly to determine the temperature is equal to or less than 45 degrees F.

Drums containing spent carbon filters and PCE waste were sealed except for the "active" PCE waste drum. This container was closed but not sealed. The drum was sealed while on site.

The Compliance Statement Report for this facility had not been received by the Department at the time of this inspection. A copy of the letter and compliance form were left with the facility and have since been received by the Department.

**RECOMMENDATIONS:** Keep all waste containers closed and sealed. All hazardous wastes, including lint and used filters, must be stored in tightly closed container. This is the second inspection where an unsealed waste container was discovered.
