**COMMENTS:** •During this inspection, I met with the facility responsible official, Mr. Song. I observed the Union L8602000 dryer. The Fluomatic- BT37 unit was not in use at this time. The perchloroethylene level in this machine's base reservoir was 35 gallons. Mr. Song stated the older unit has not been used since October 2005. He stated the condenser coils were leaking and he was considering replacing with a new hydrocarbon dryer. I informed Mr. Song he could have the vendor possibly transfer the perchloroethylene to the Union L860U2000 machine.

• I reviewed the calendar record. Mr. Song is recording temperatures observations and perchloroethylene usage in only one calendar for the working dry cleaning machine. The 12 month total was 0.7 gallons, because Mr. Song had not purchased any perchloroethylene since October 2005. The temperature readings during his observations ranged from 32°F – 34°F.

• I observed the dryer, during the cool down cycle. The temperature was registering at 32°F, on the temperature readout behind machine. I did not detect any perchloroethylene odors during the operation and the observations of area behind the dryer. The hazardous waste receptacles were in place in secondary containment. The additional waste receptacles are in the containment area of the boiler room. (See photos)

• I asked Mr. Song to contact me if he removes the B37 machine. (See photos)

• This facility is in compliance.
