**COMMENTS:**

8/22/2006- This follow up inspection was to observe the dry cleaning equipment to determine if the condenser outlet temperature was capable of attaining 45° F or less. The condenser was replaced and additional repairs appear to be effective.

- I checked the calendar record and found the responsible official had been recording temperatures of 40– 43°F since February. The responsible official had started recording temperatures weekly after 2/7/2006 inspection, as required under the existing large classification.
- Mrs. Kerrutt had repair receipts for June and July in calendar.
- 6/1/2006. - The mechanic replaced the condenser with a new one.
- 7/14/2006 – The mechanic returned and replaced the button door gasket.
- The perchloroethylene usage appears to be declining, and the facility is now under the 140- gallon limit. Mrs. Kerrut stated she had not had to purchase Perc as often. I informed her that the repairs of leaks and condenser replacement are likely reducing the Perc usage. She stated that is has reduced her need for Perc, as we observed the purchase invoices.
- 7/19/2006 – Hazardous waste manifest shows pick up of perc sludge.
- I observed the drying equipment as completed the end of cycle.
- There were no Perc odors detected during the inspection. I used the Halogen detector and did not register any leaks at this time.
- I informed her of the new rule and regulations regarding the requirement to obtain a Halogen detector and gave her copy of the rule update, and the P2 brochure. I spoke to her again about in the future if purchase of new equipment may want to consider hydrocarbon.
